

Comparable corpus scale

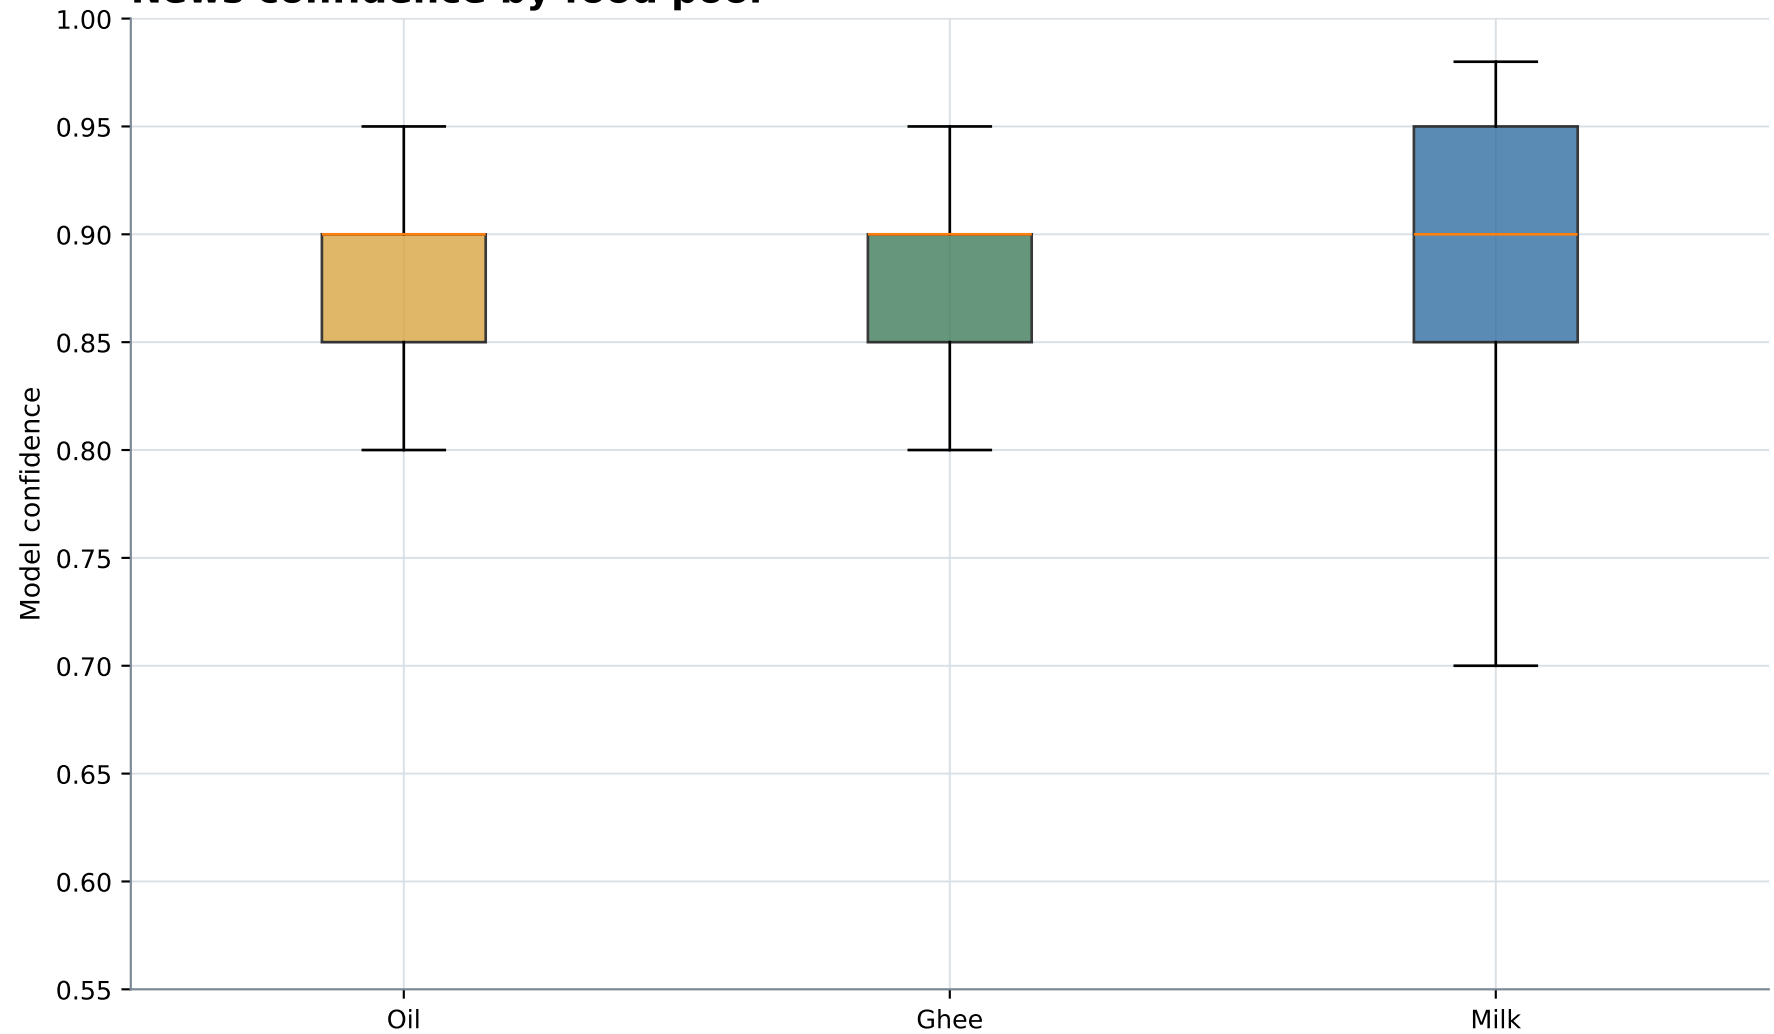

Knowledge-graph breadth

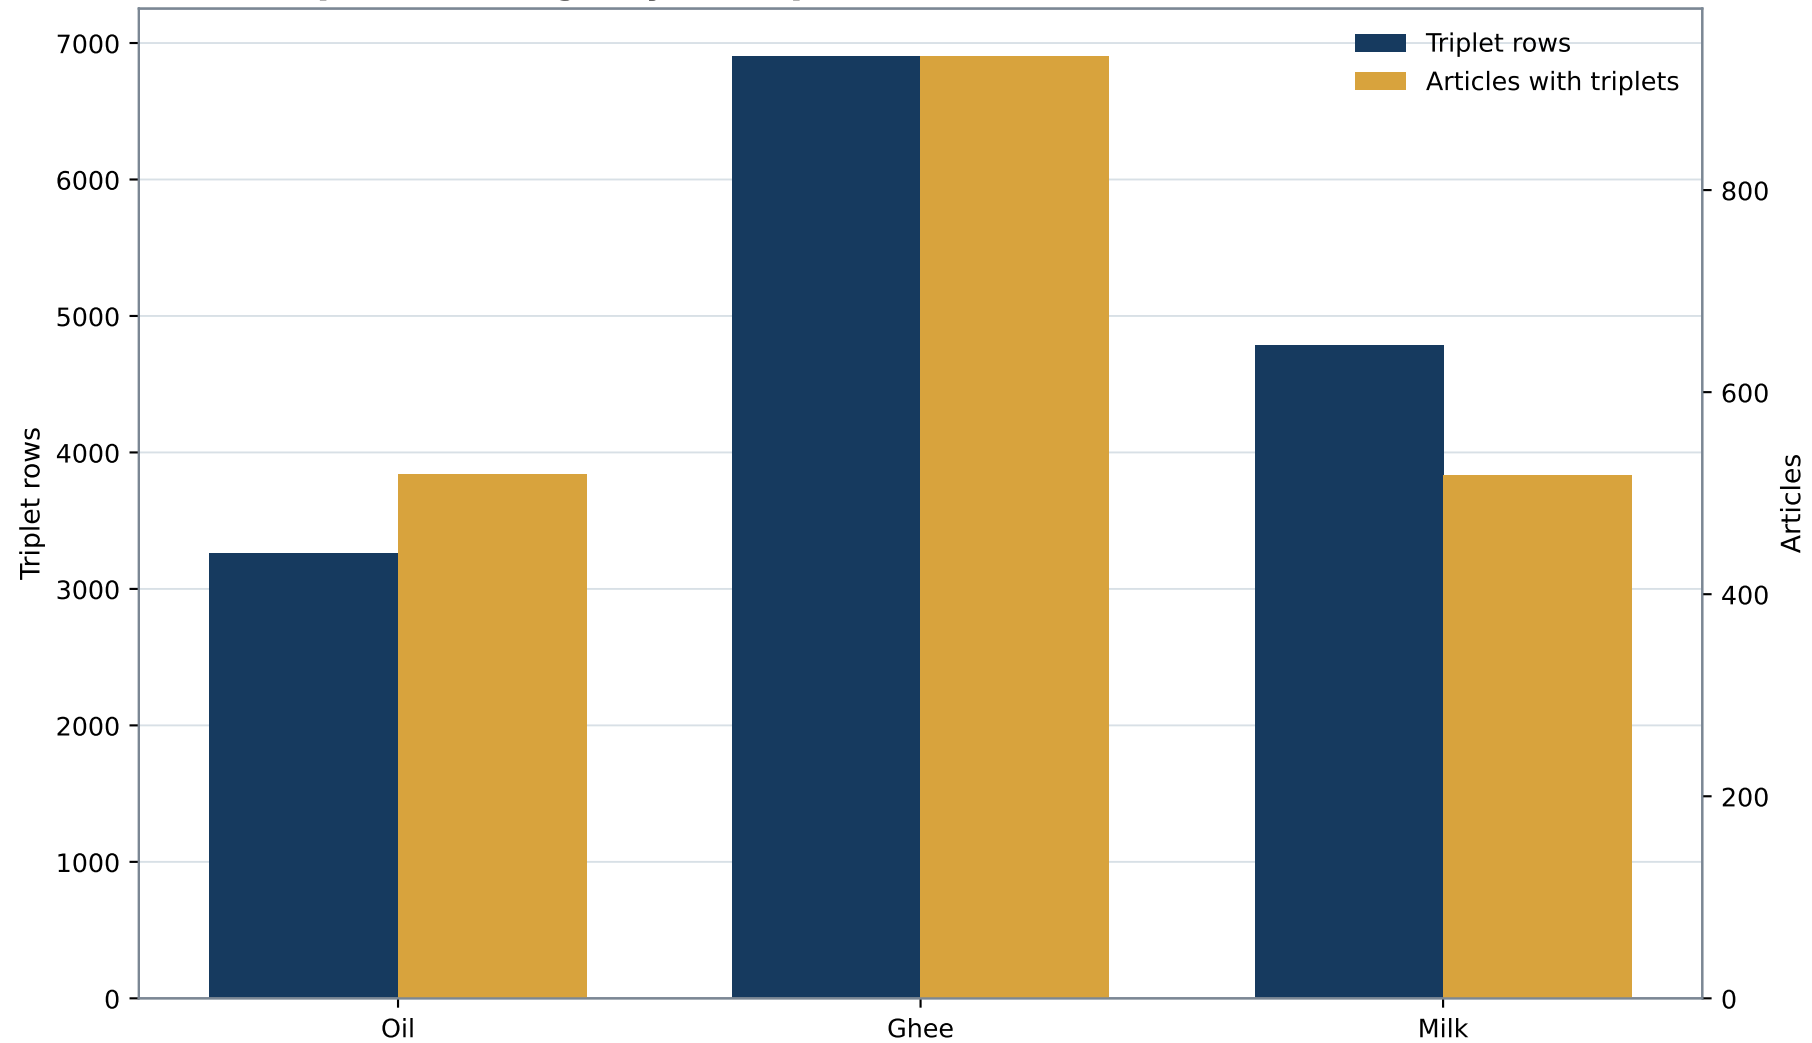

Confidence distributions

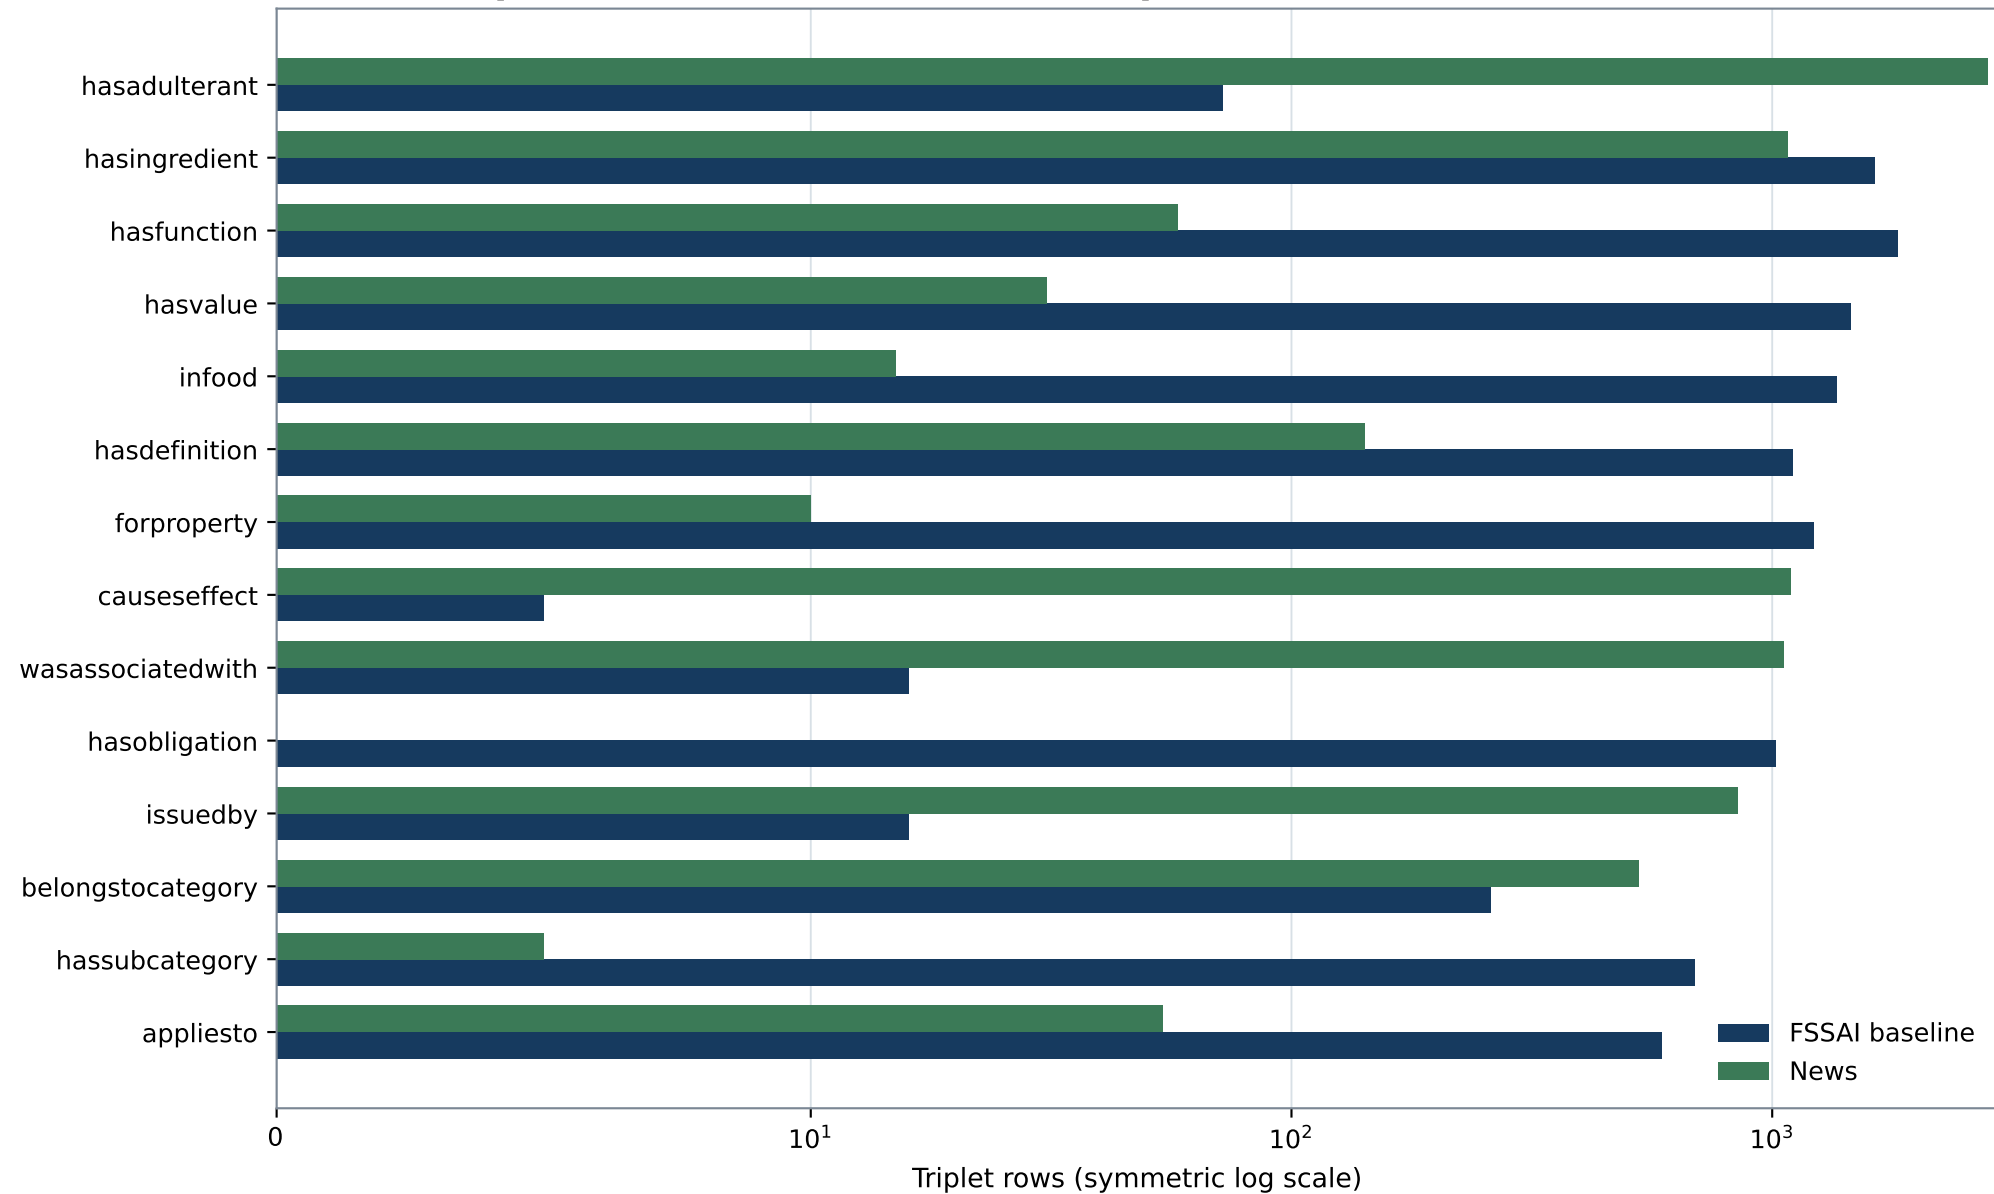

News confidence by food pool

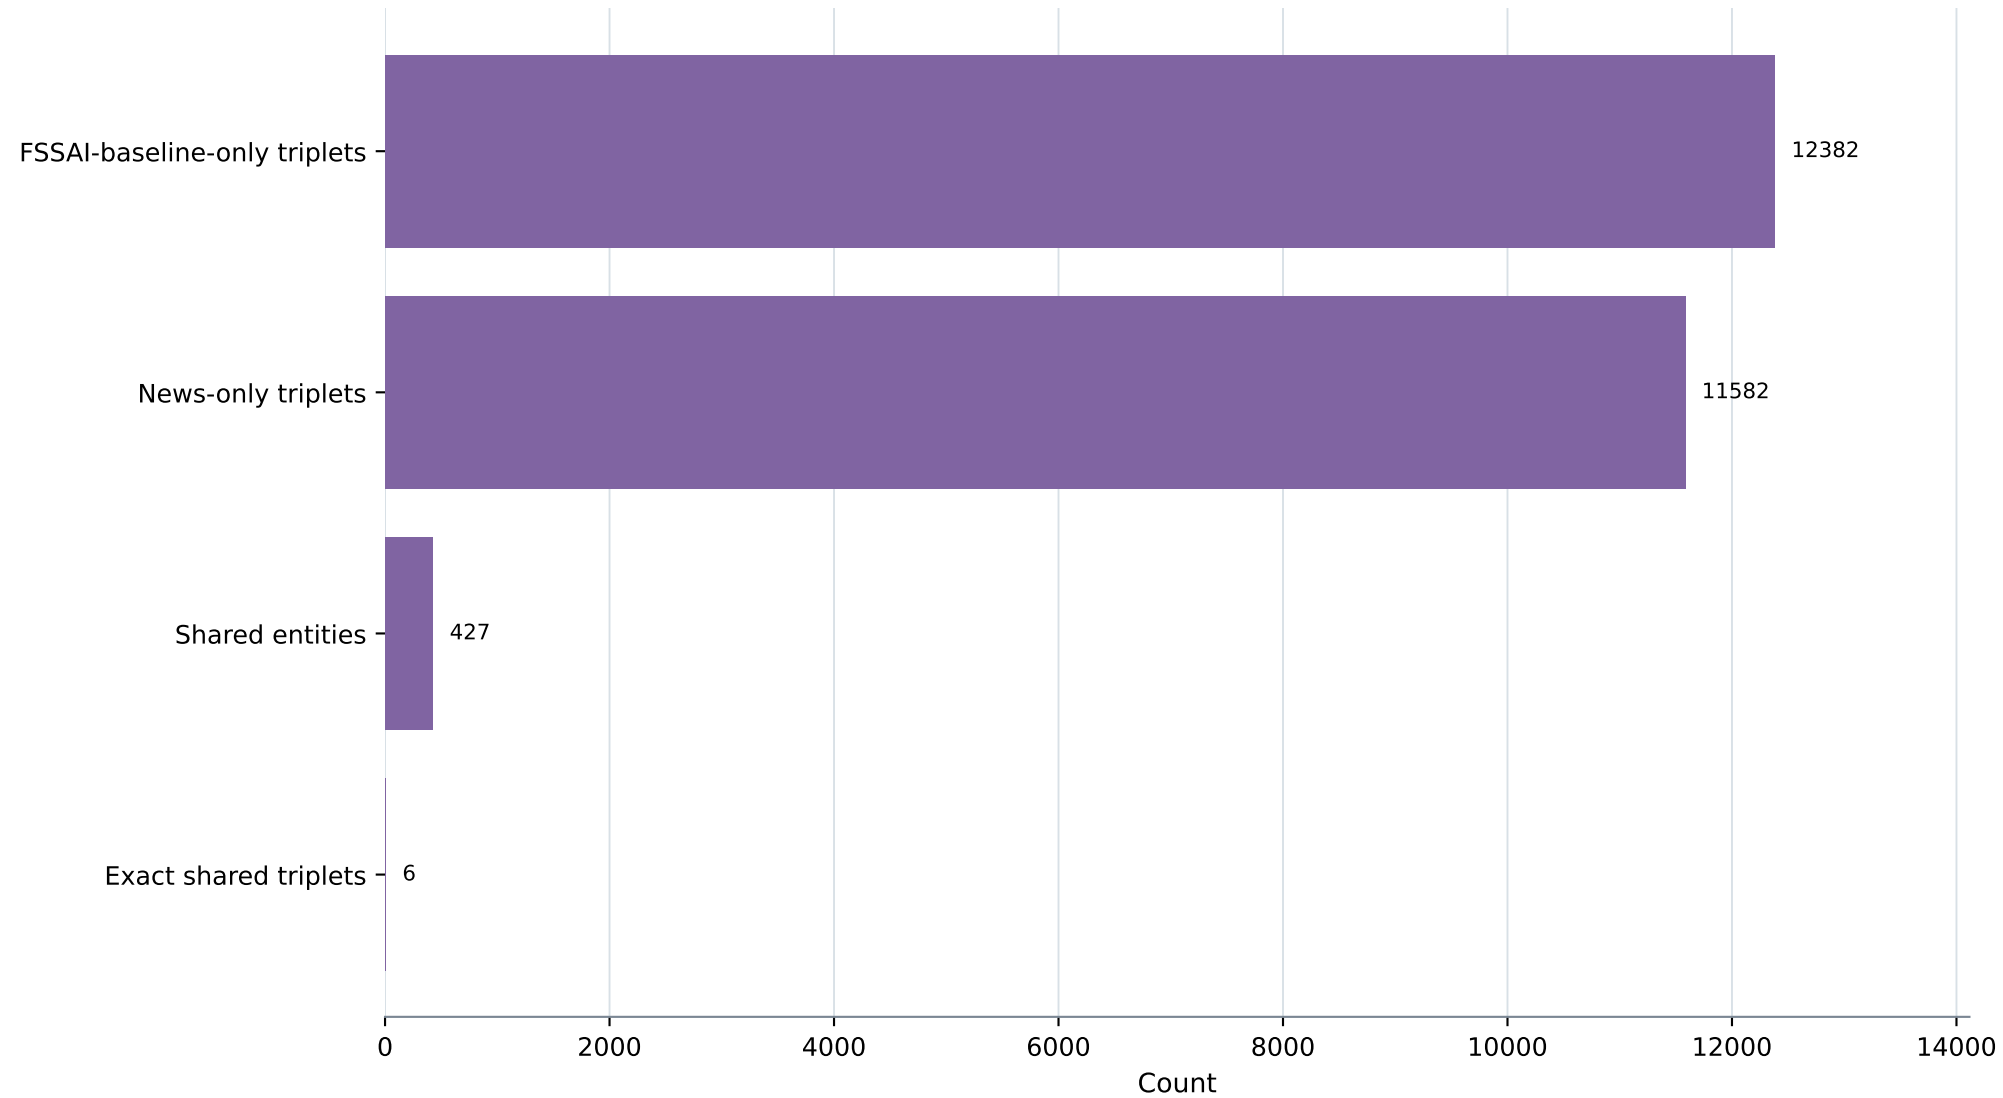

News-triplet coverage by food pool

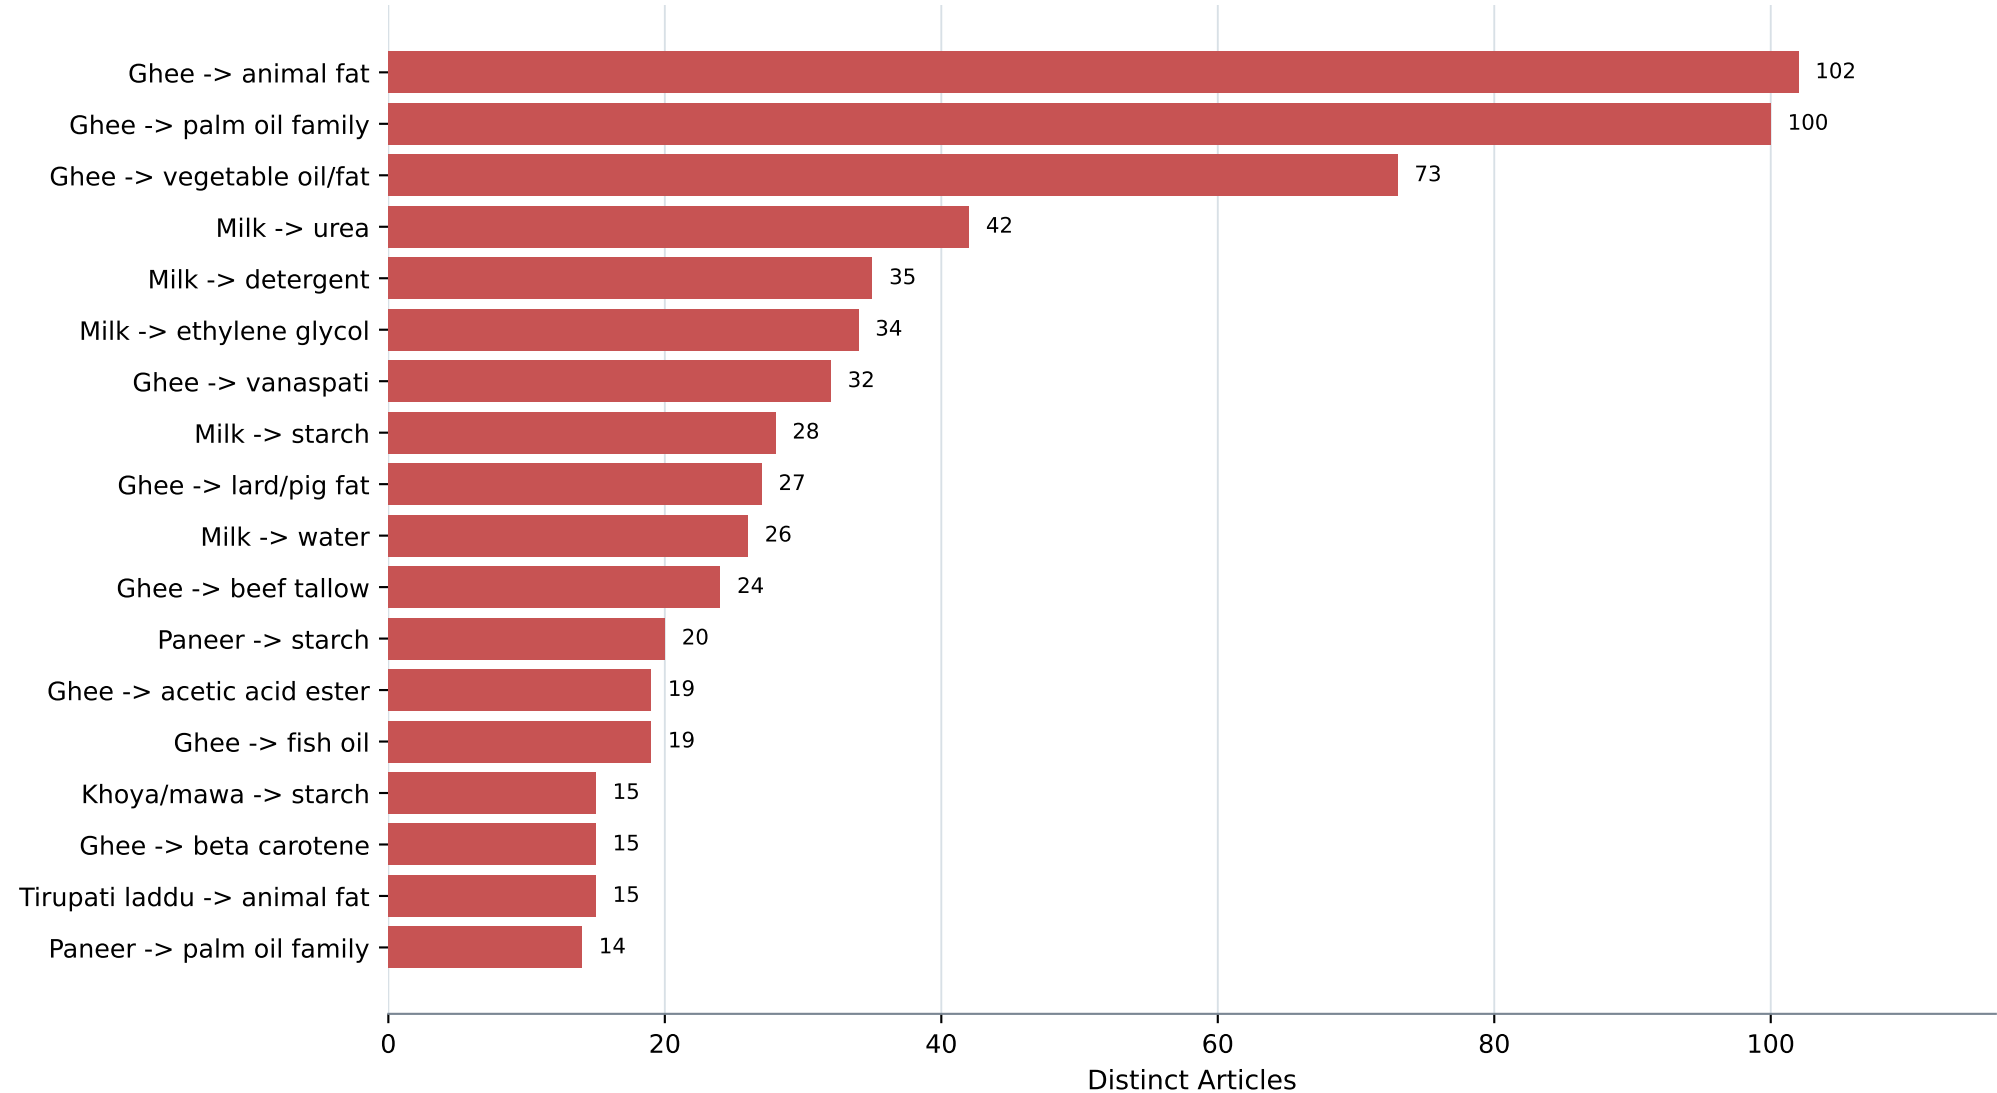

Dominant predicates reveal different corpus functions

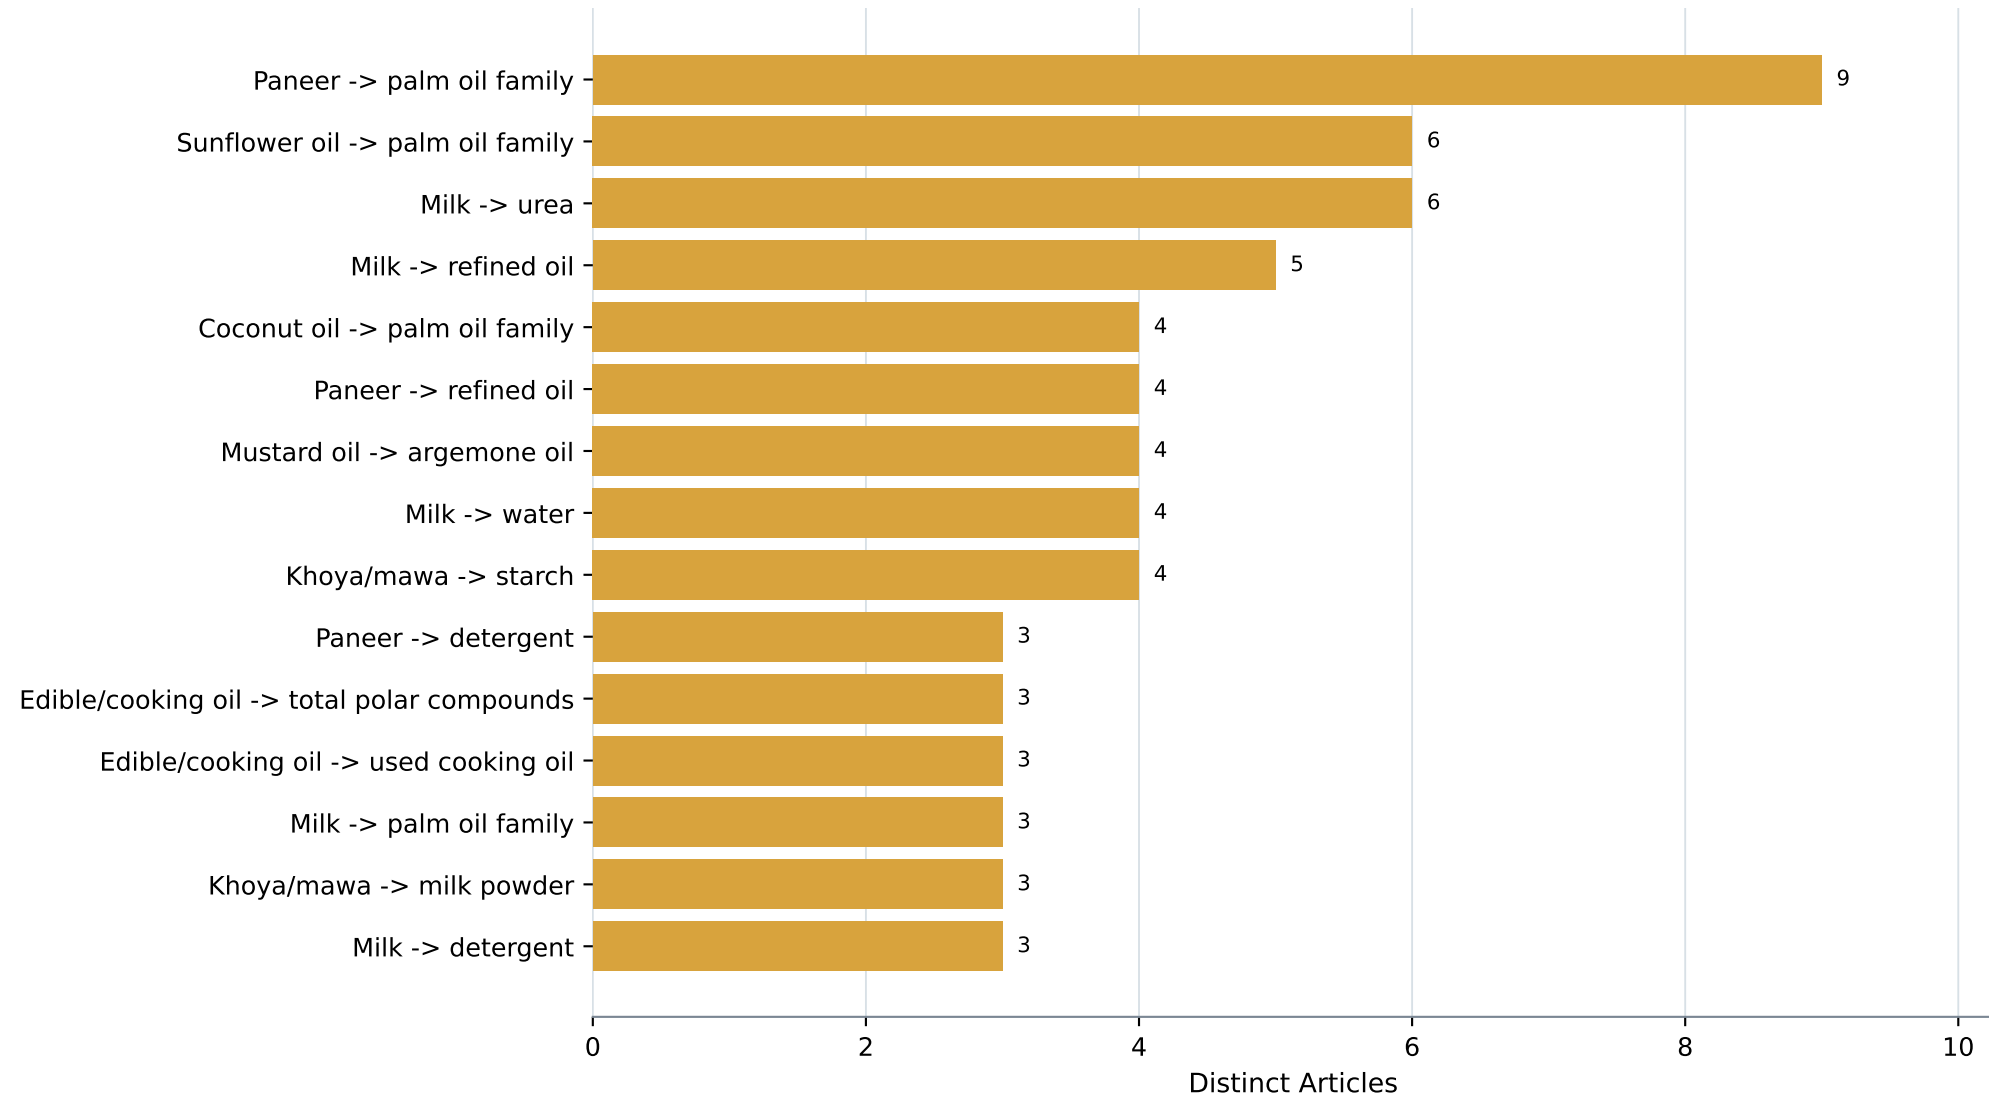

Normalized overlap is sparse

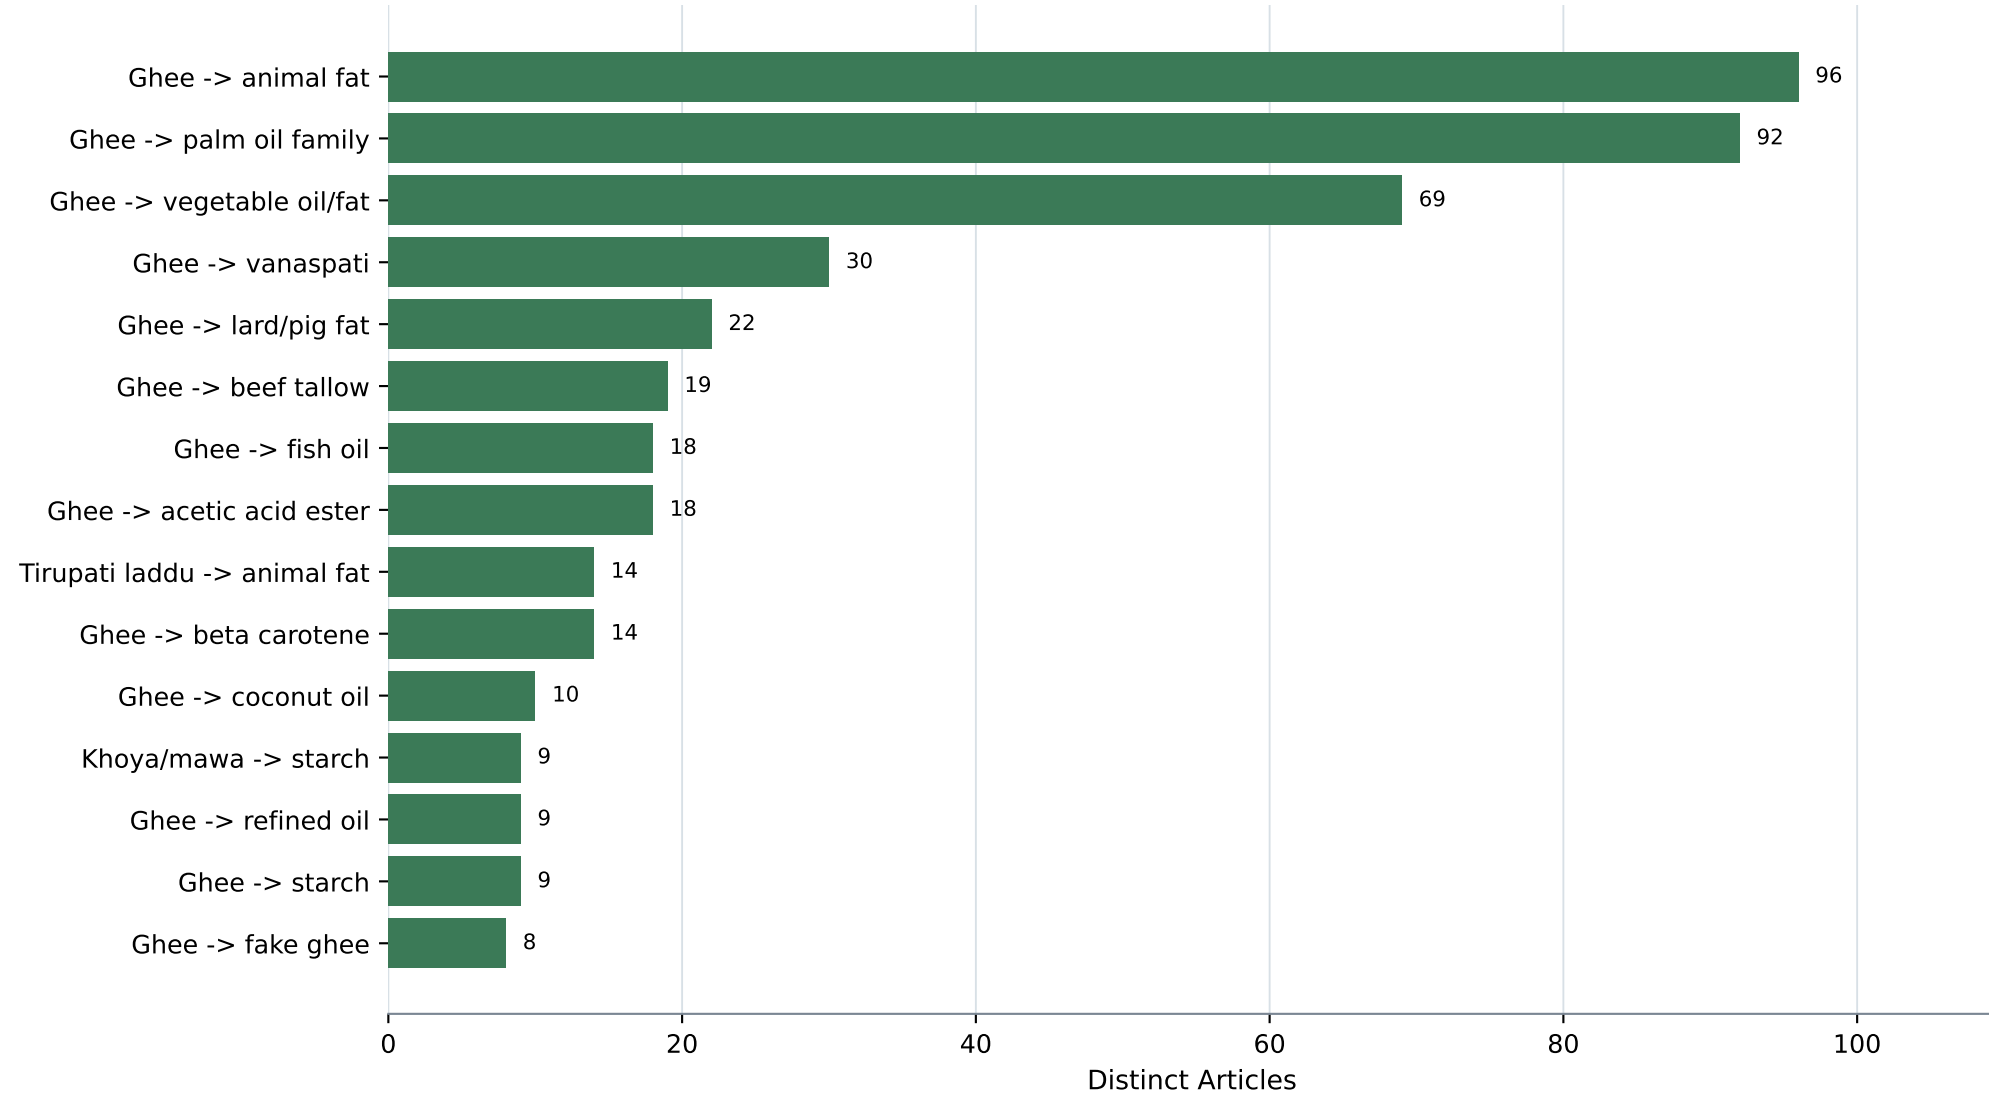

Most reported food-adulterant relationships

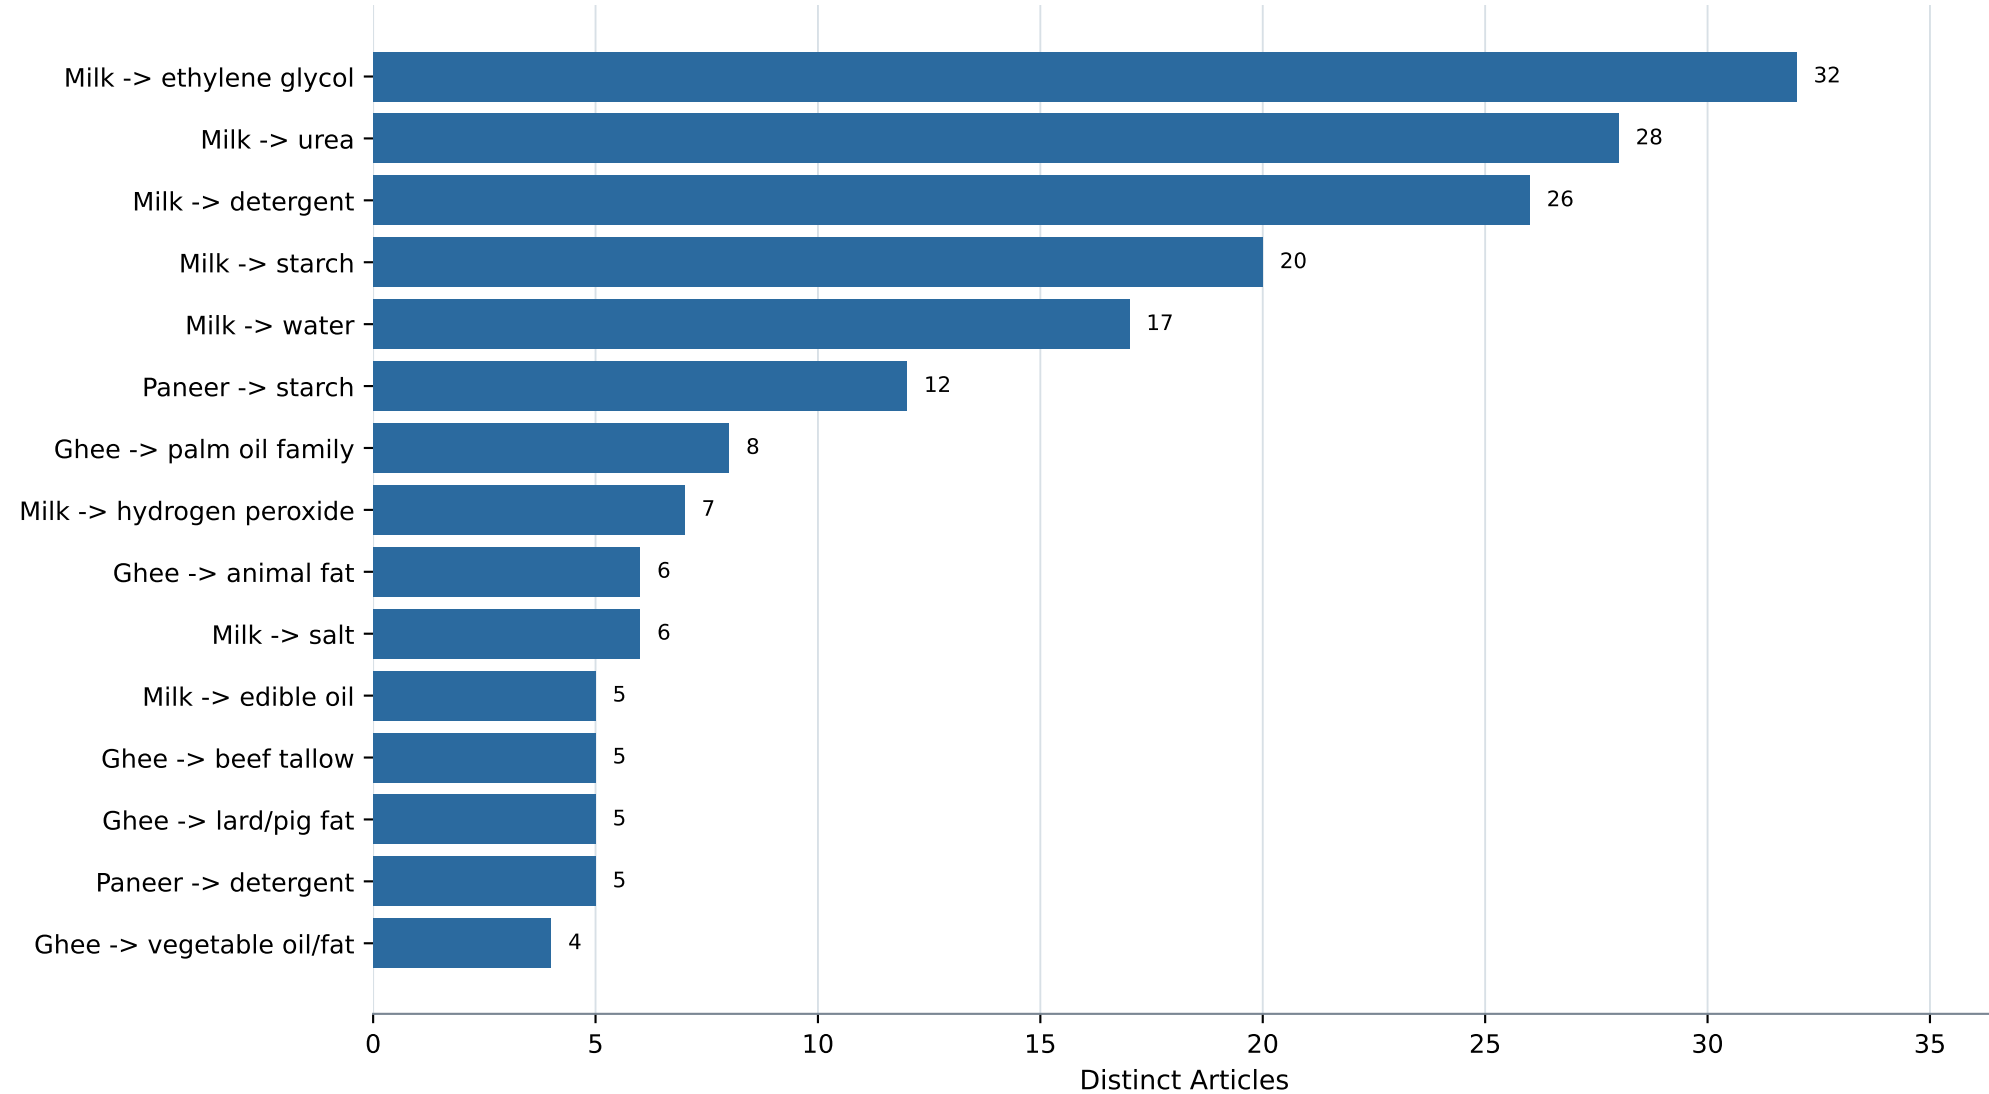

Most reported relationships in the Oil article pool

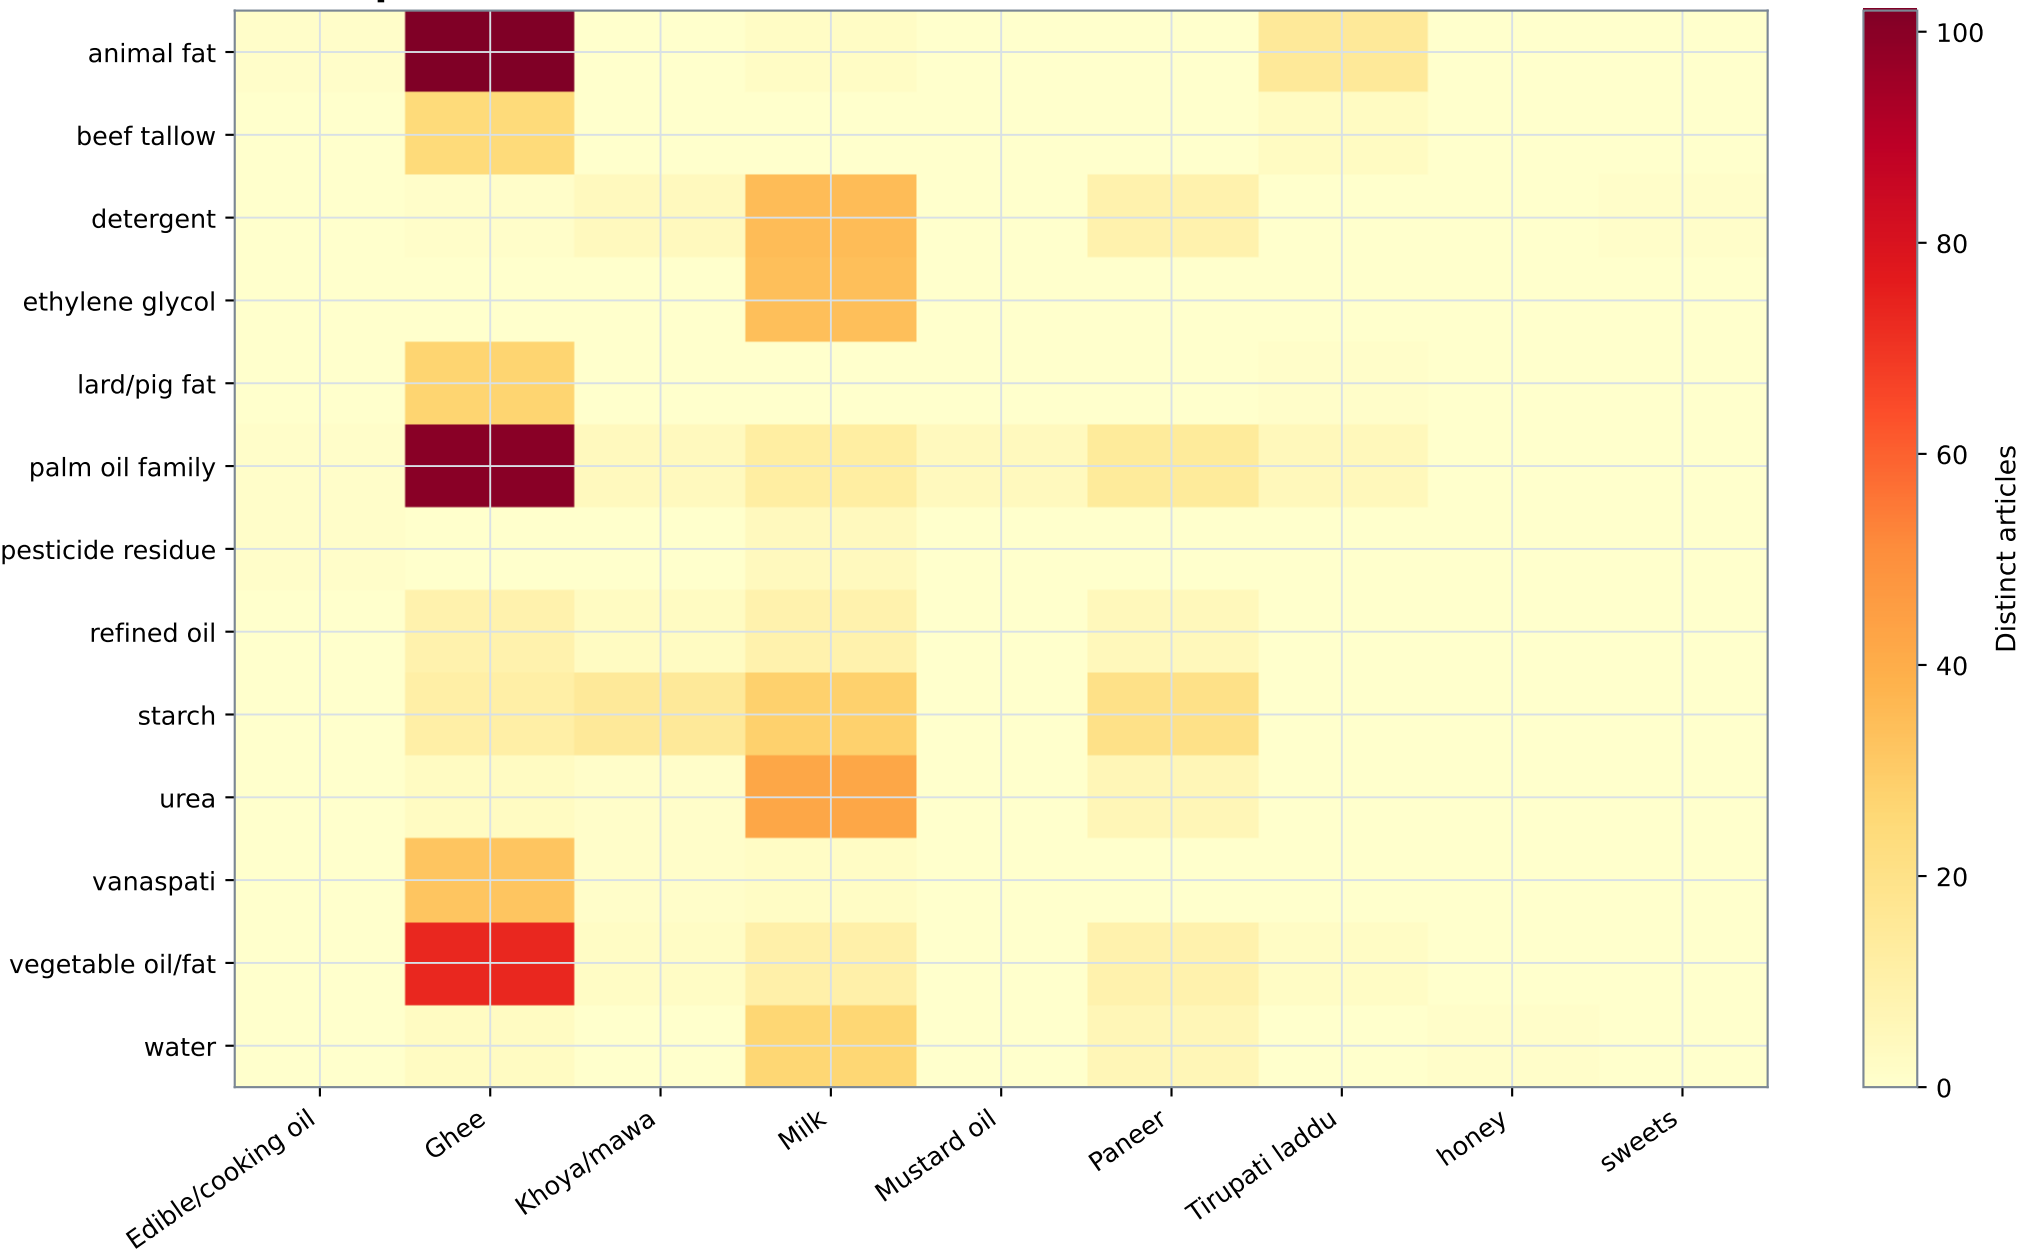

Most reported relationships in the Ghee article pool

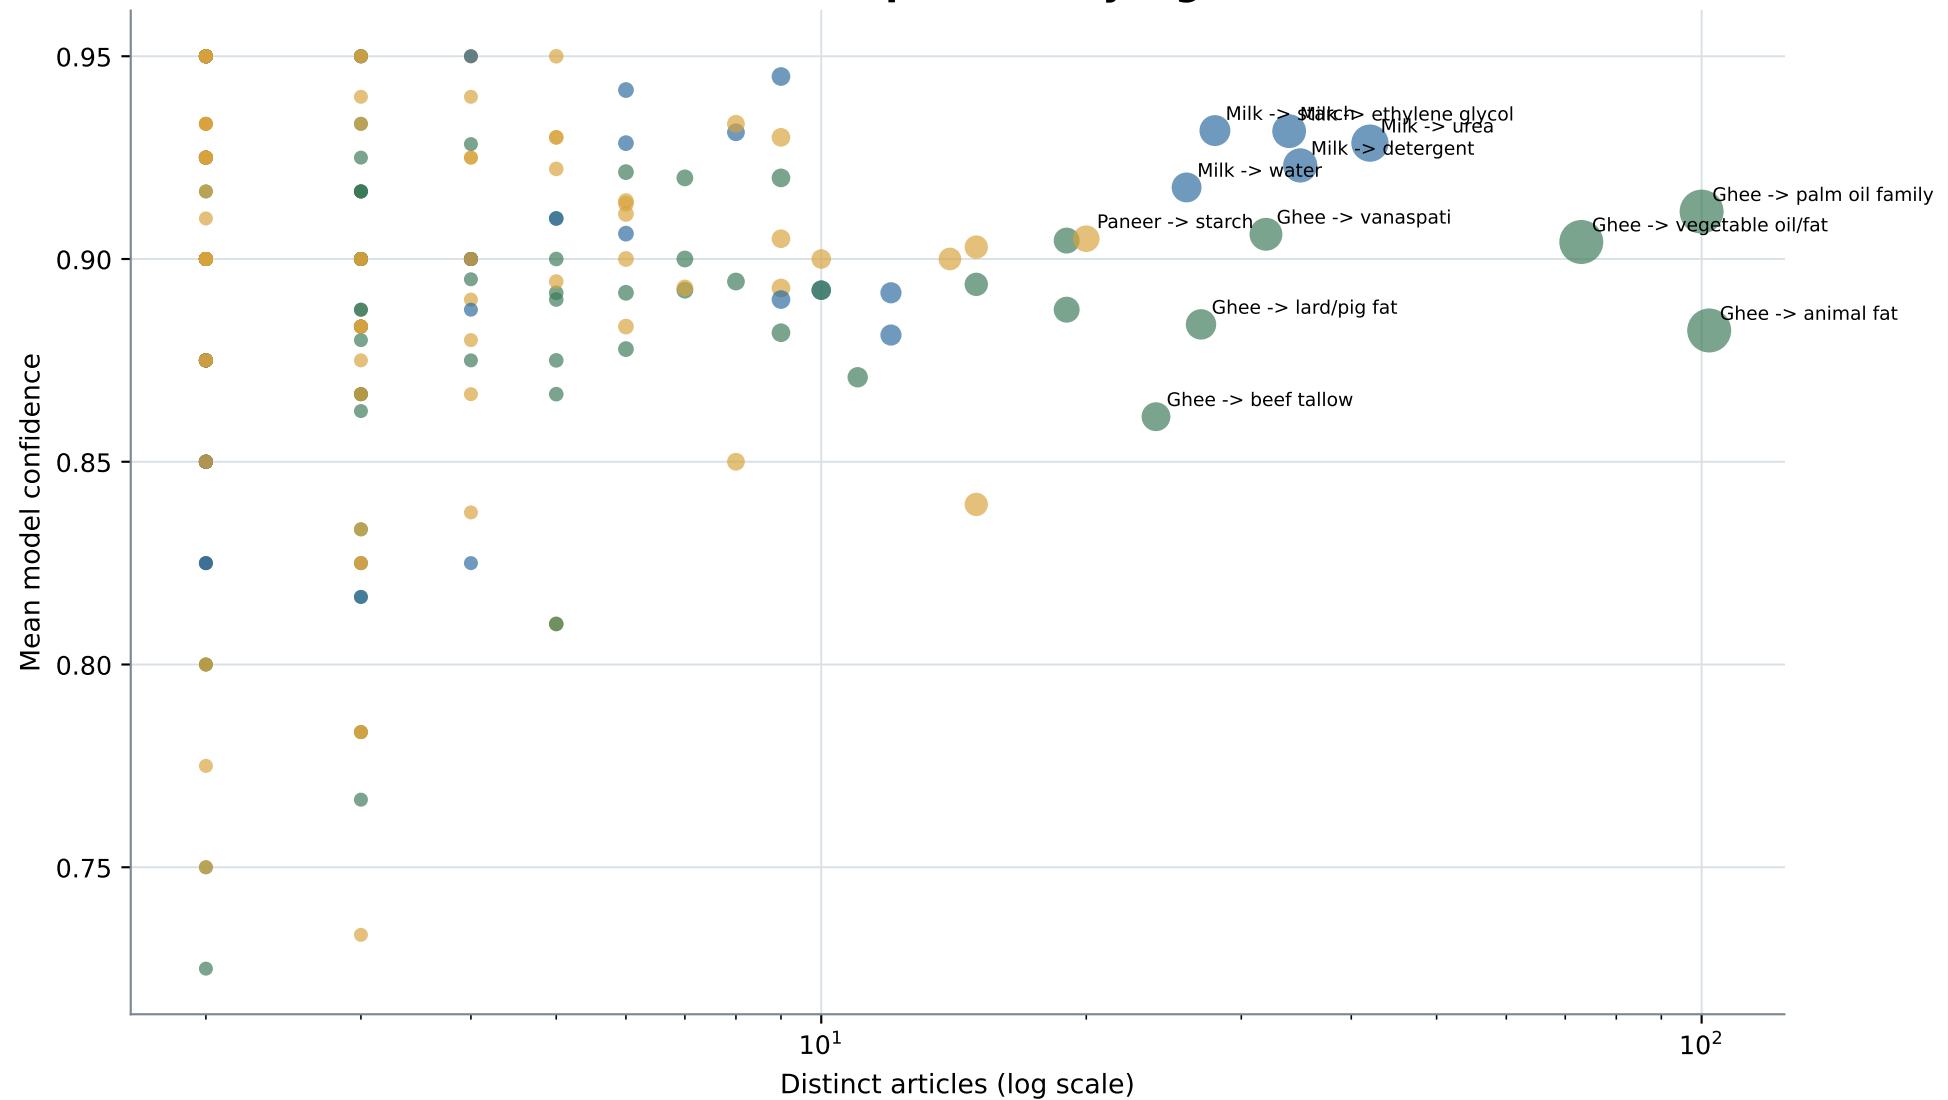

Most reported relationships in the Milk article pool

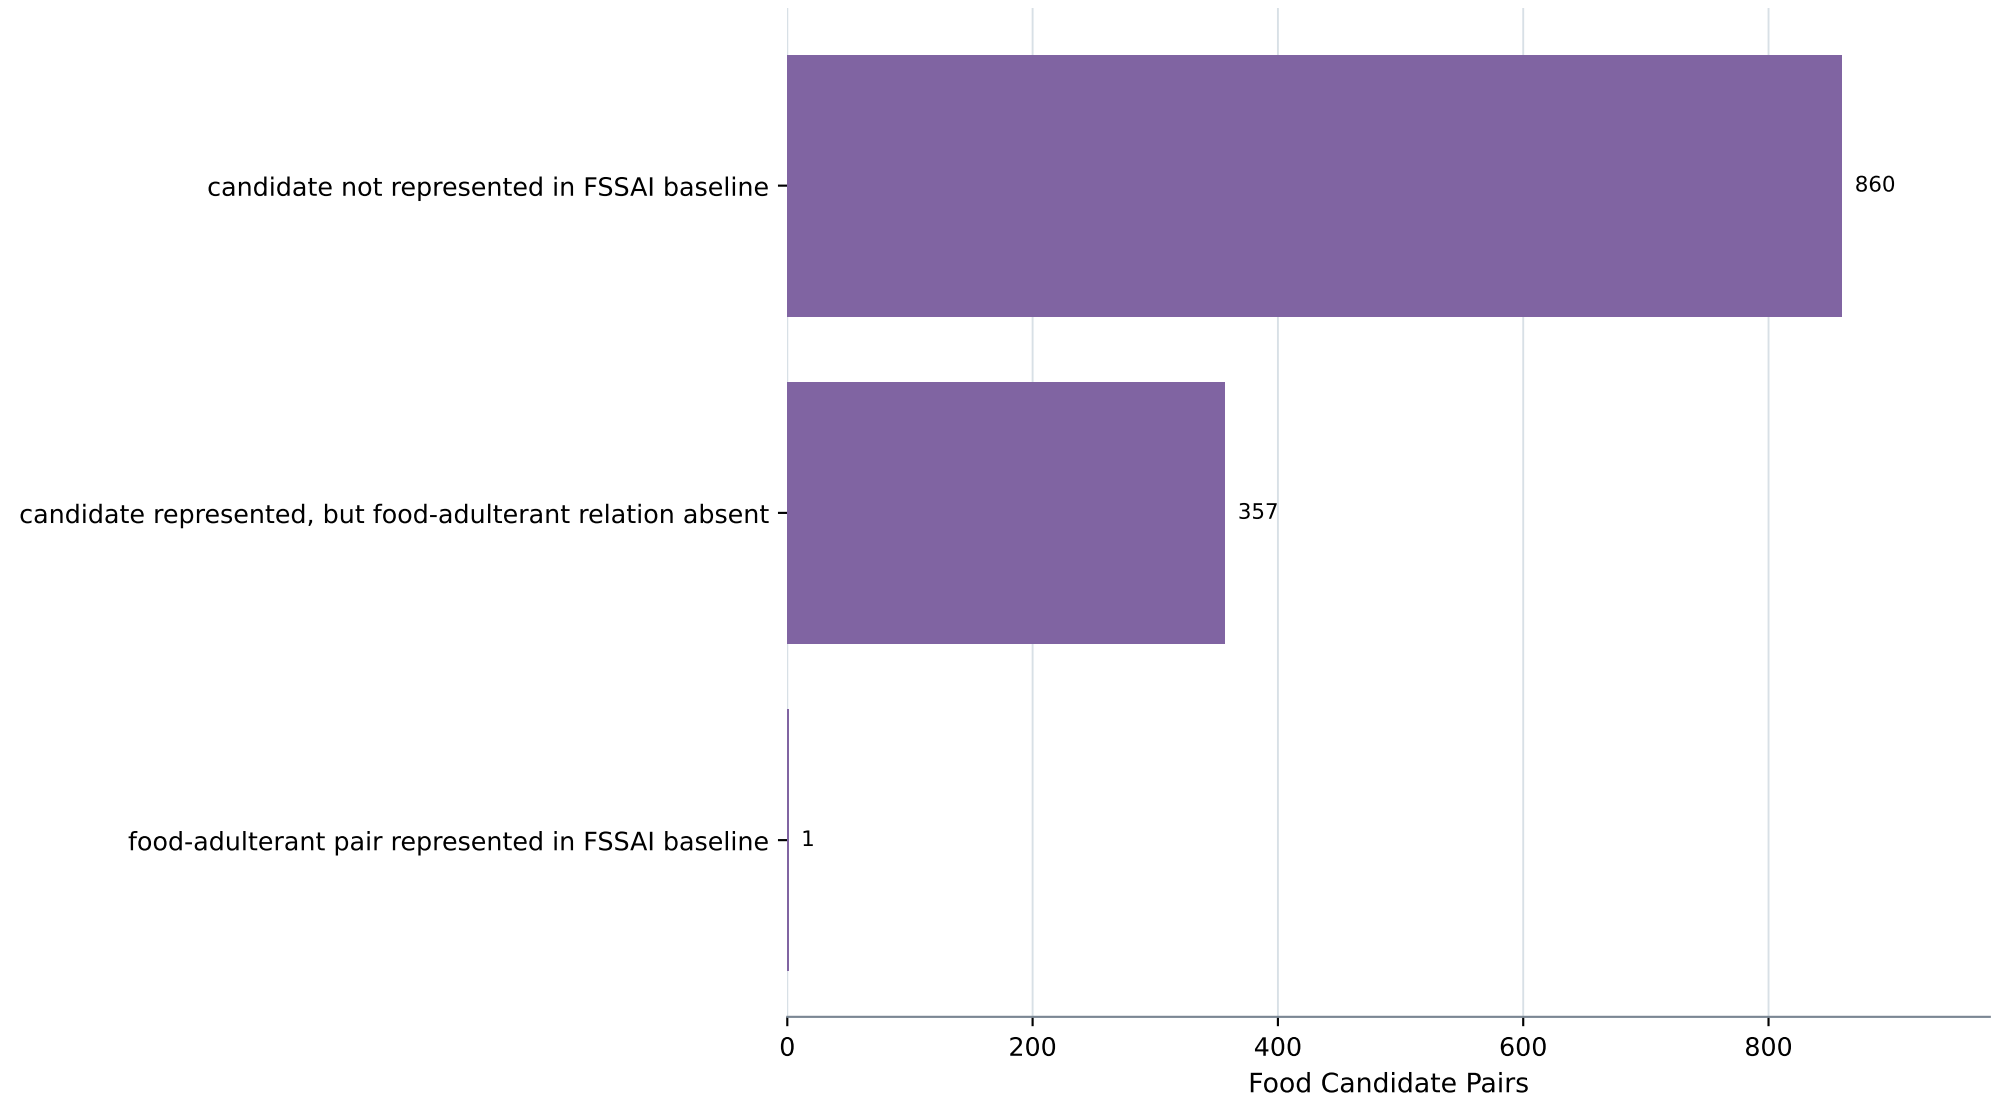

Food-specific adulterant article matrix

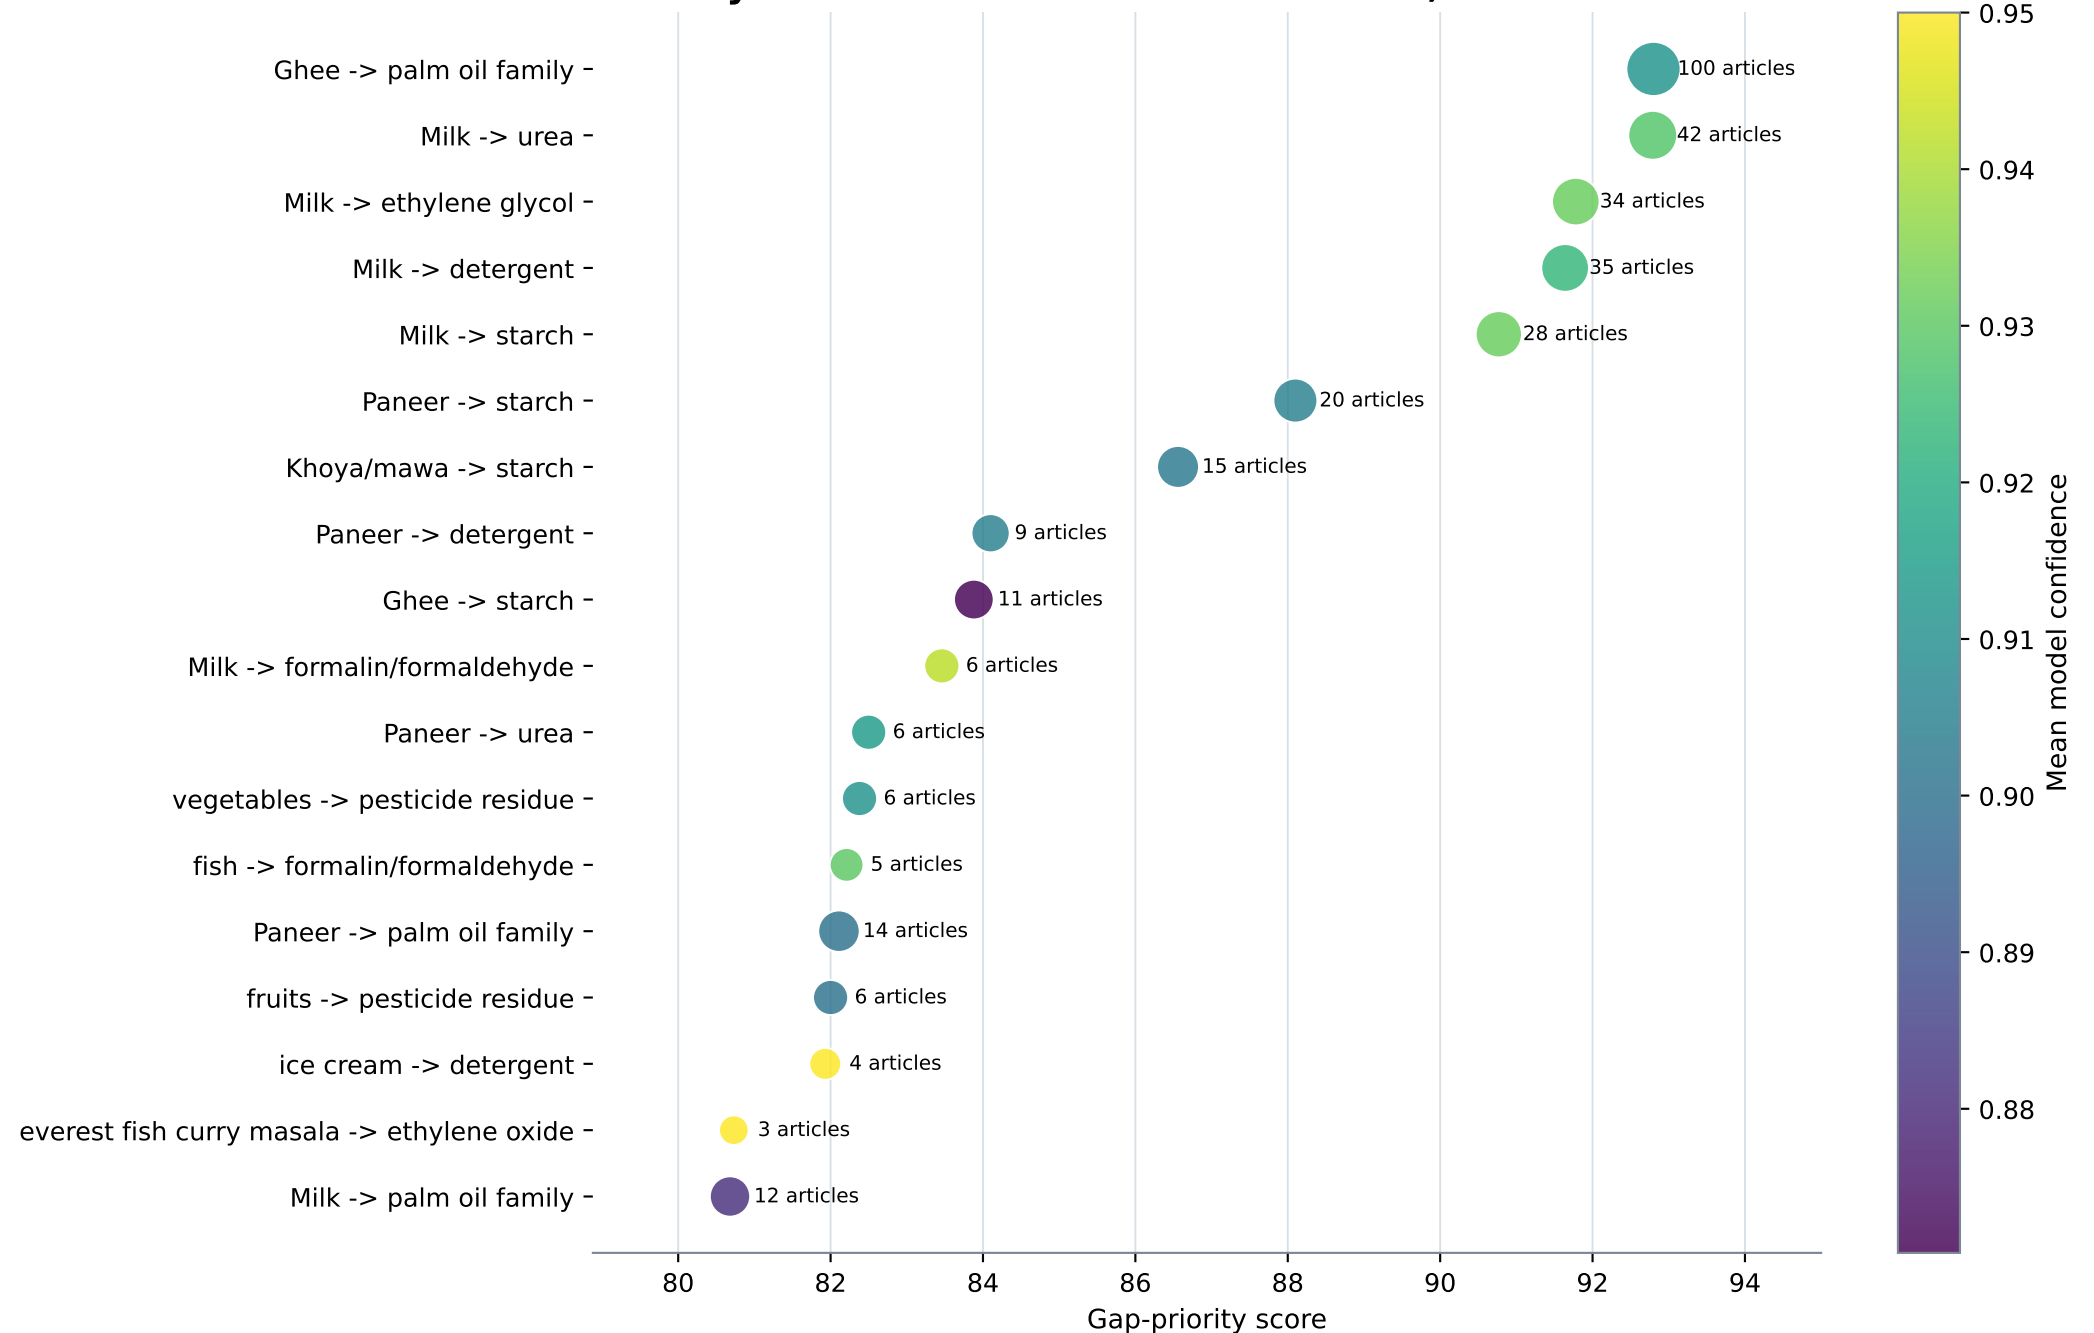

Recurrence and confidence are complementary signals

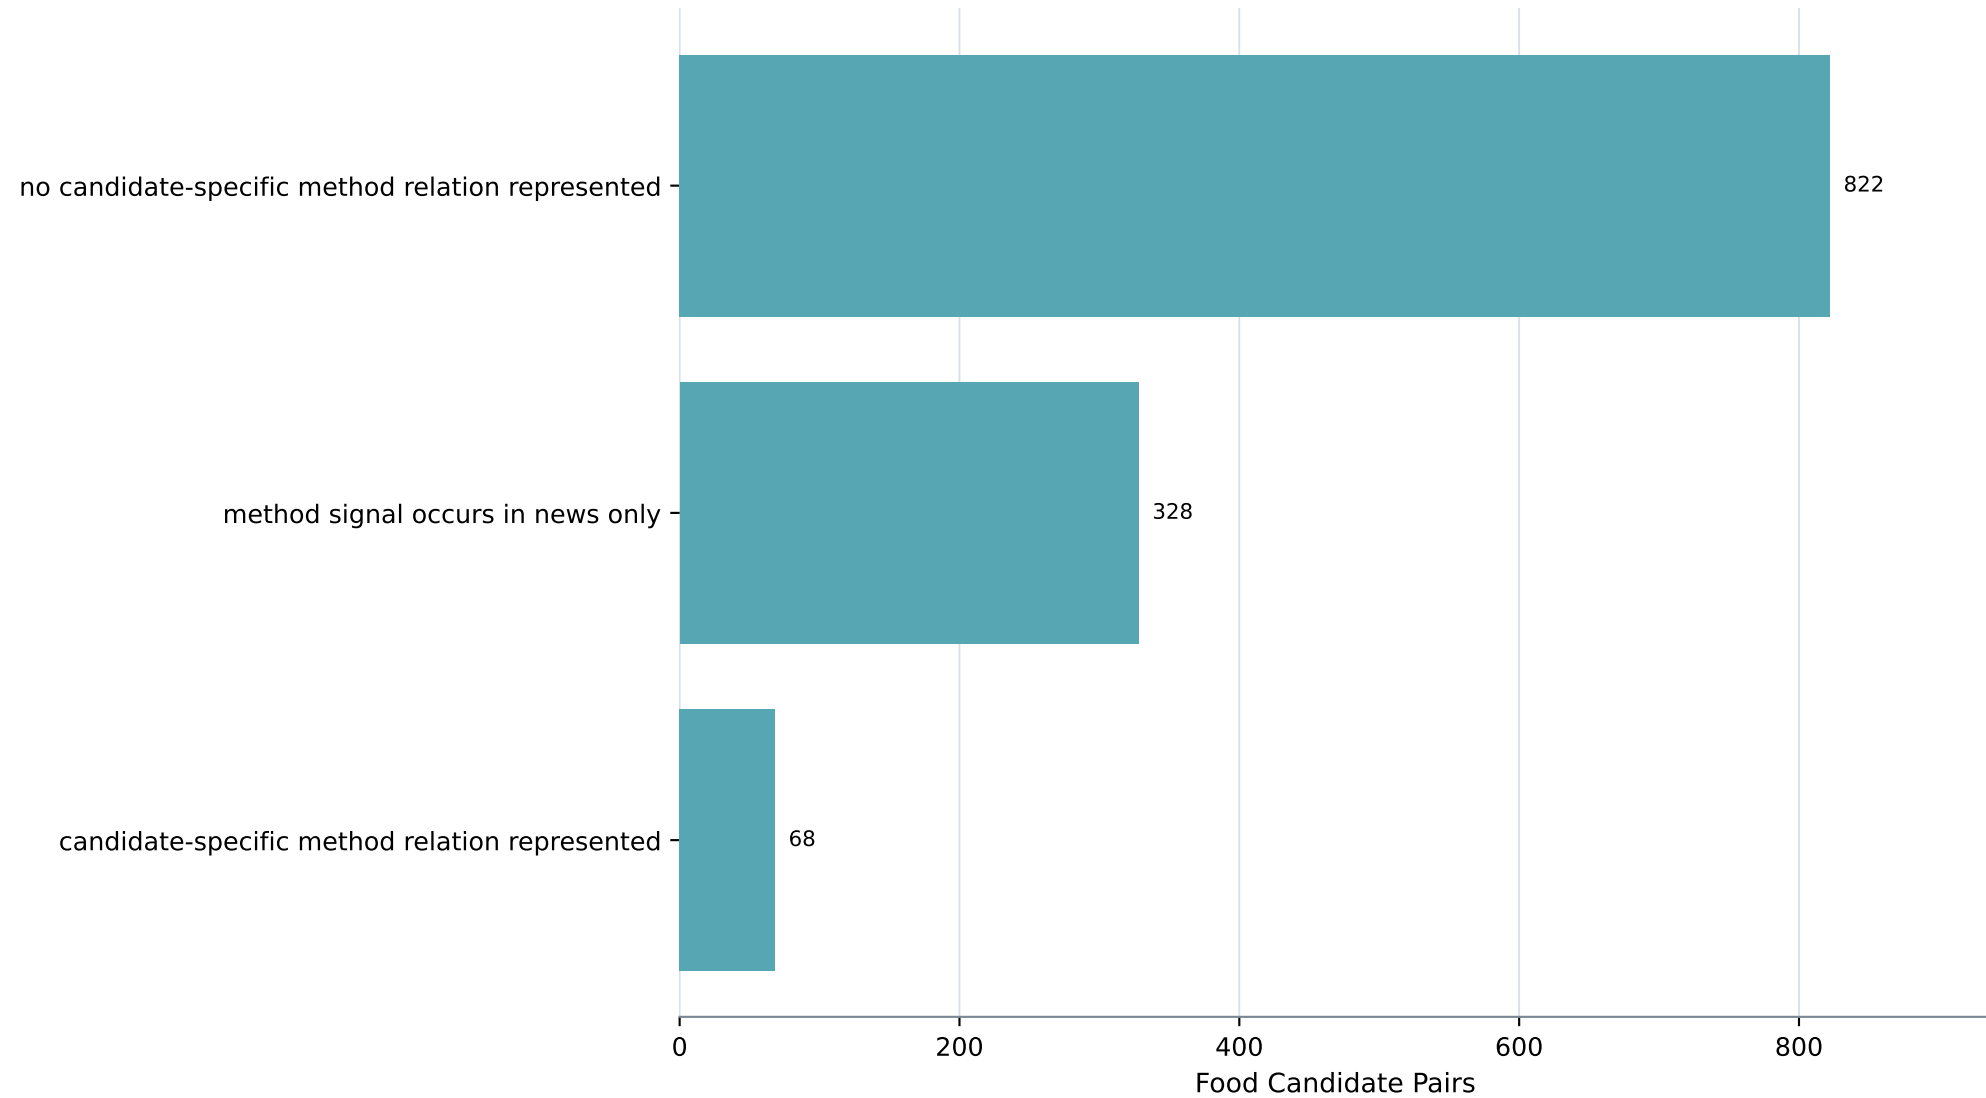

FSSAI baseline representation classes

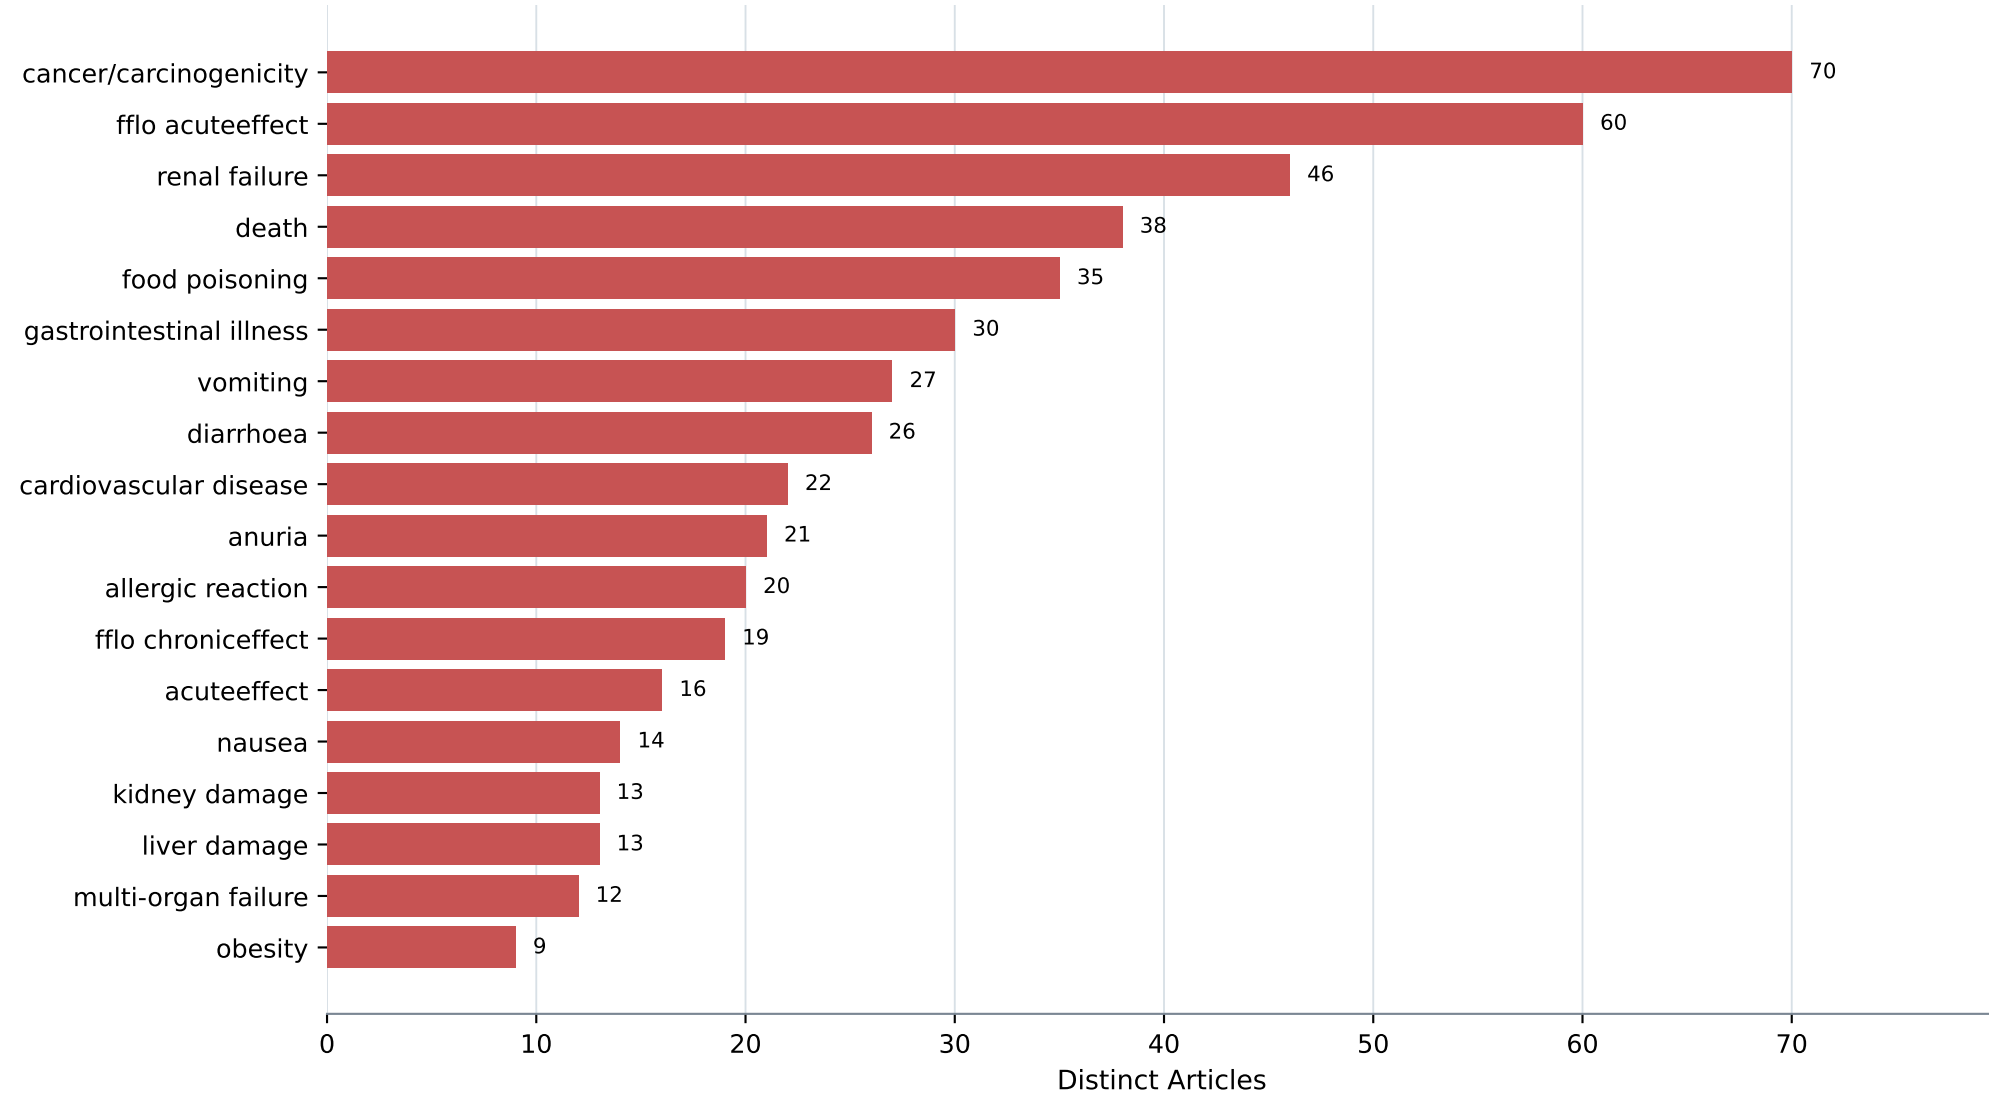

Priority candidates combine recurrence, confidence and local health links

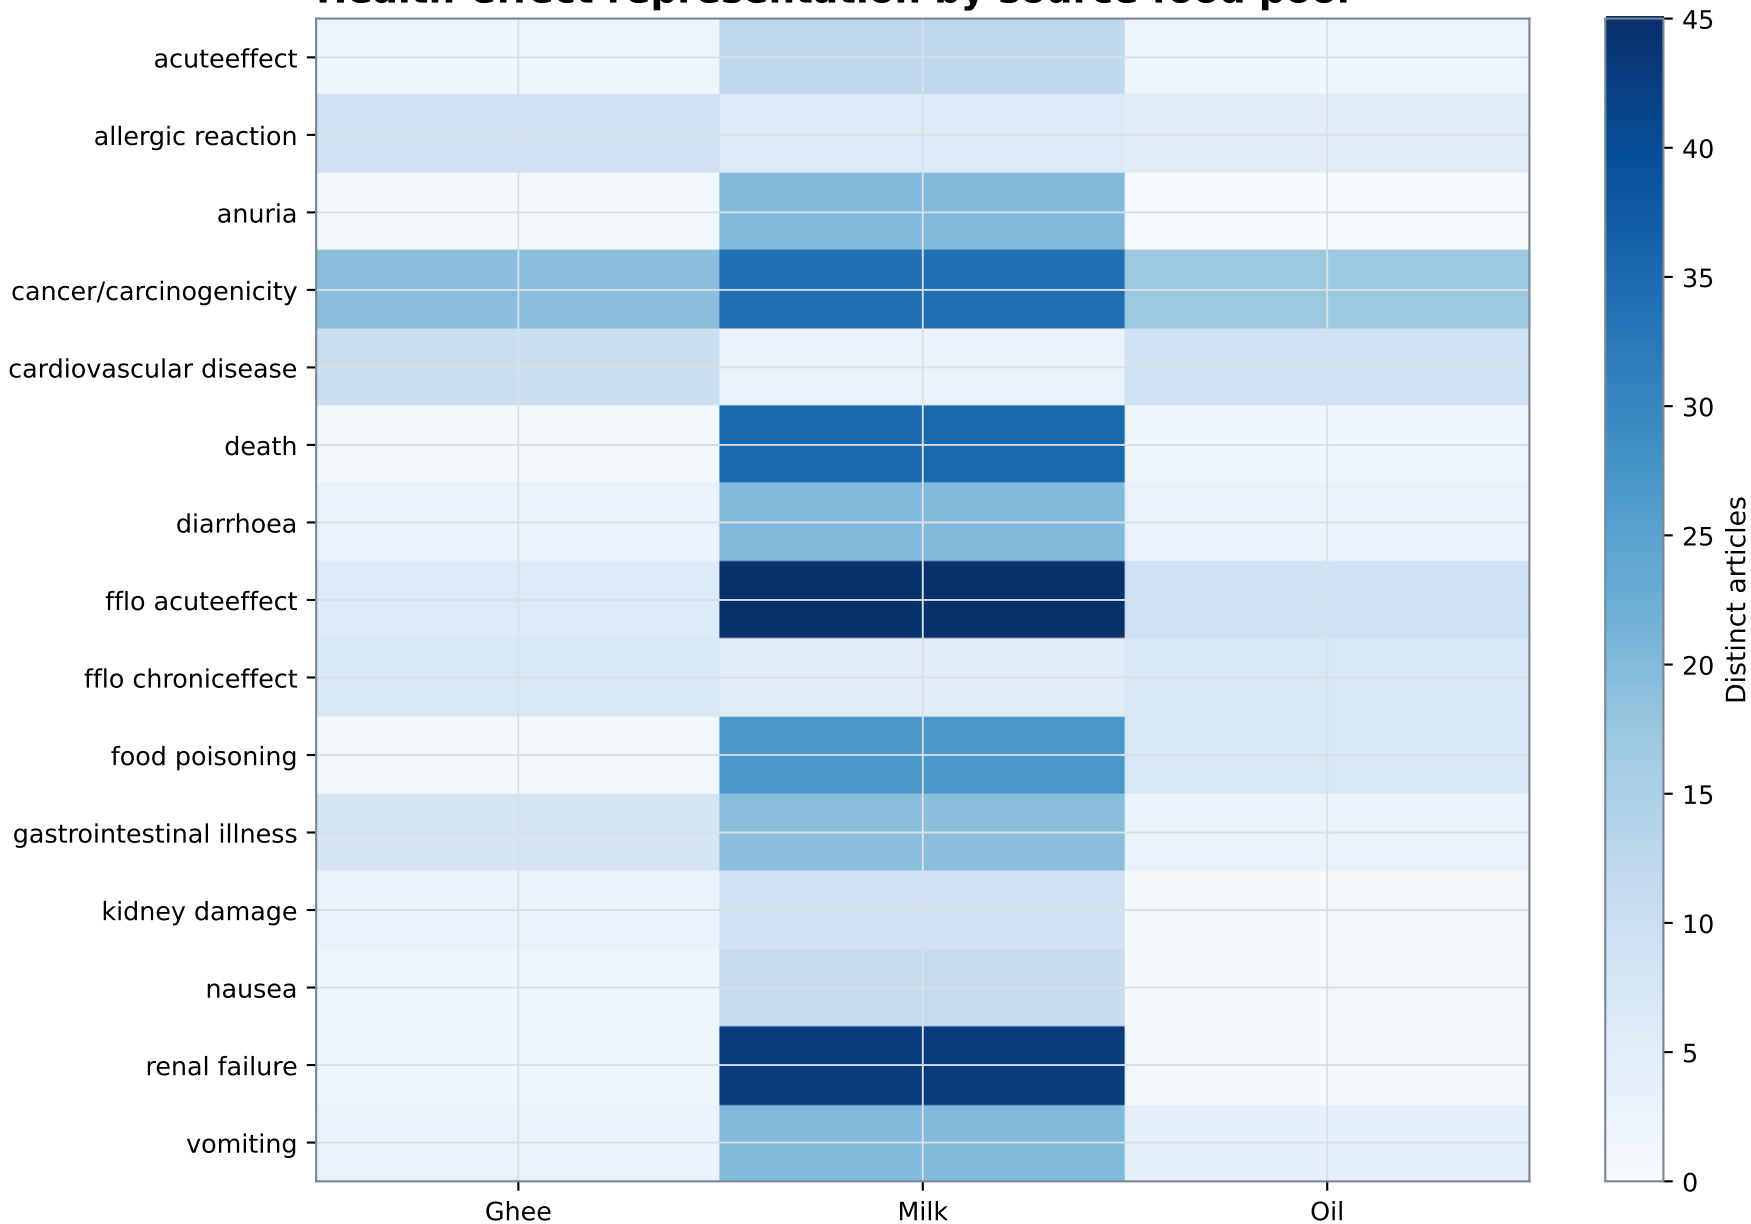

Candidate-specific test representation

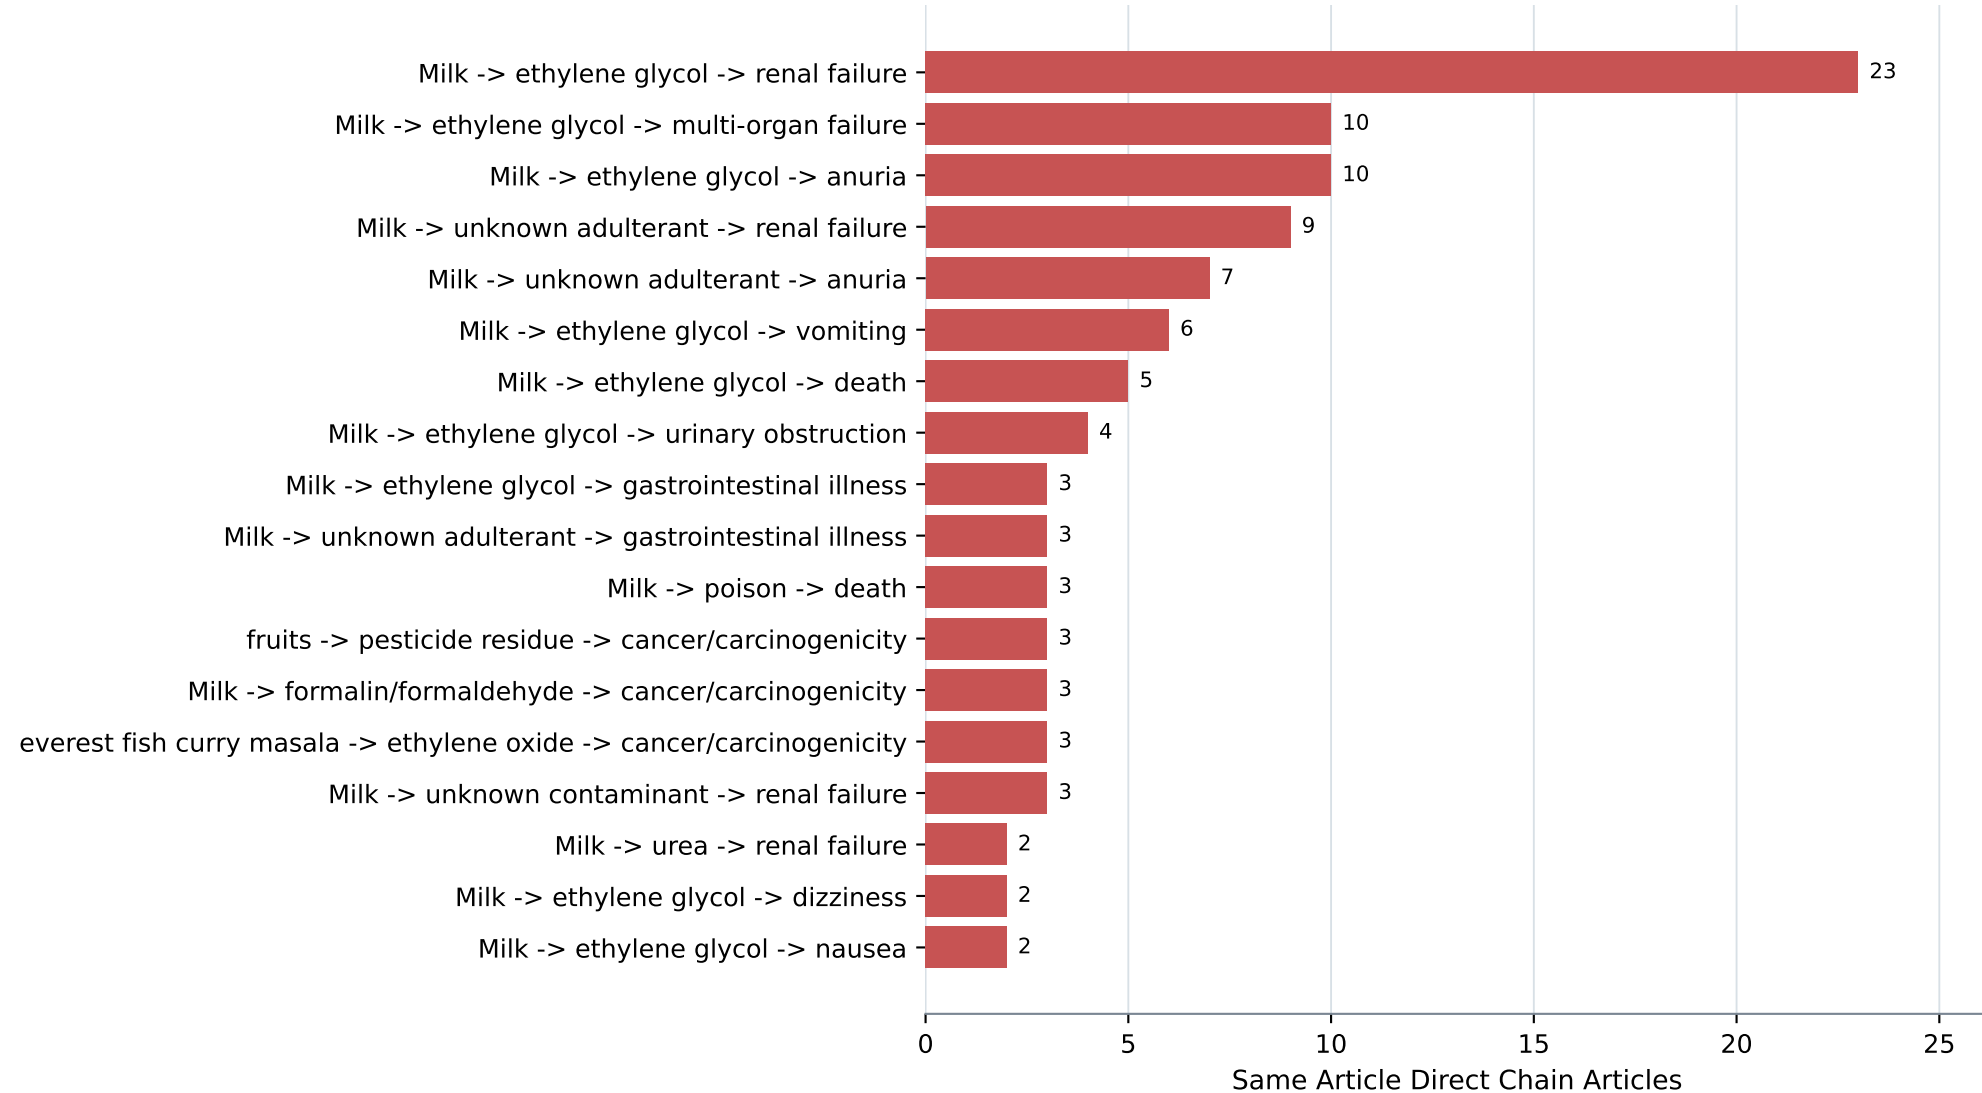

Most represented health effects in news triplets

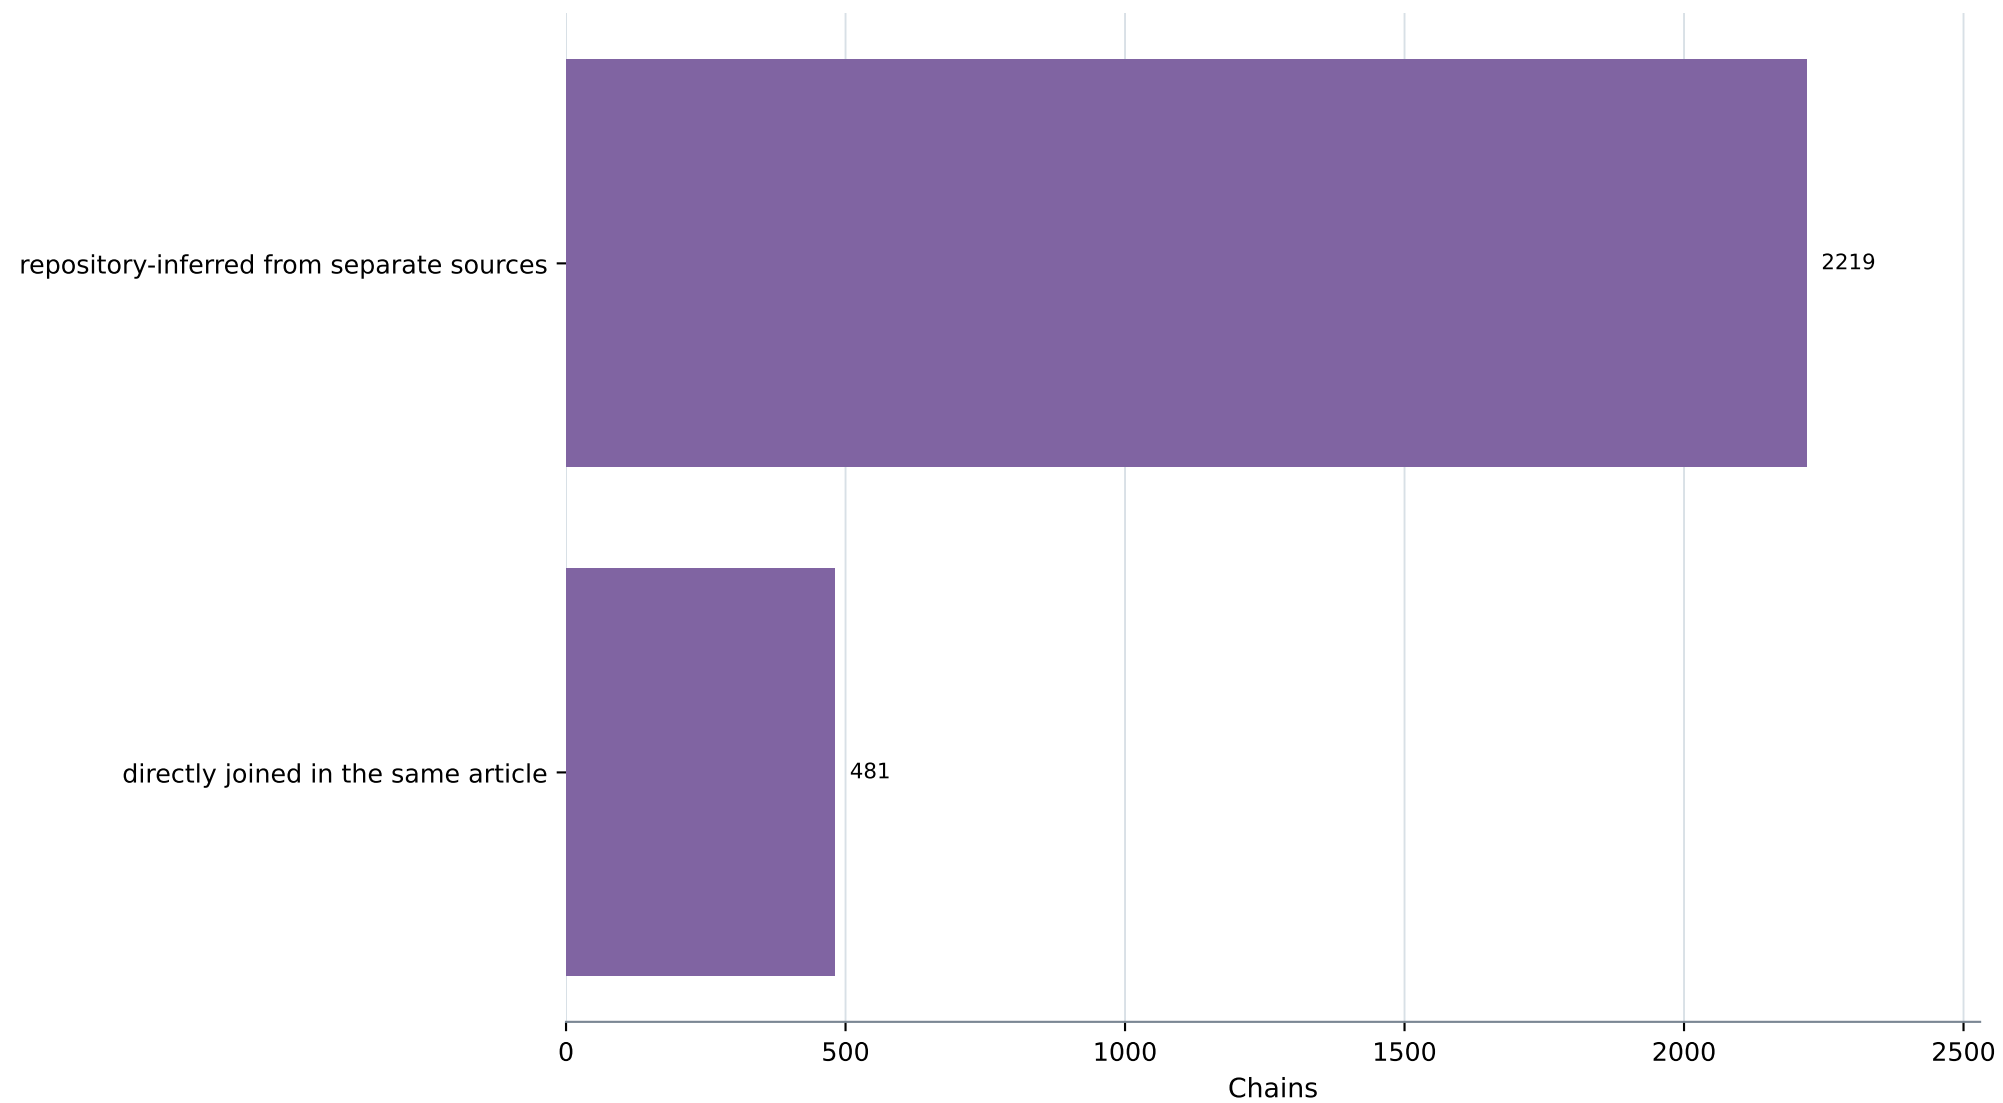

Health-effect representation by source food pool

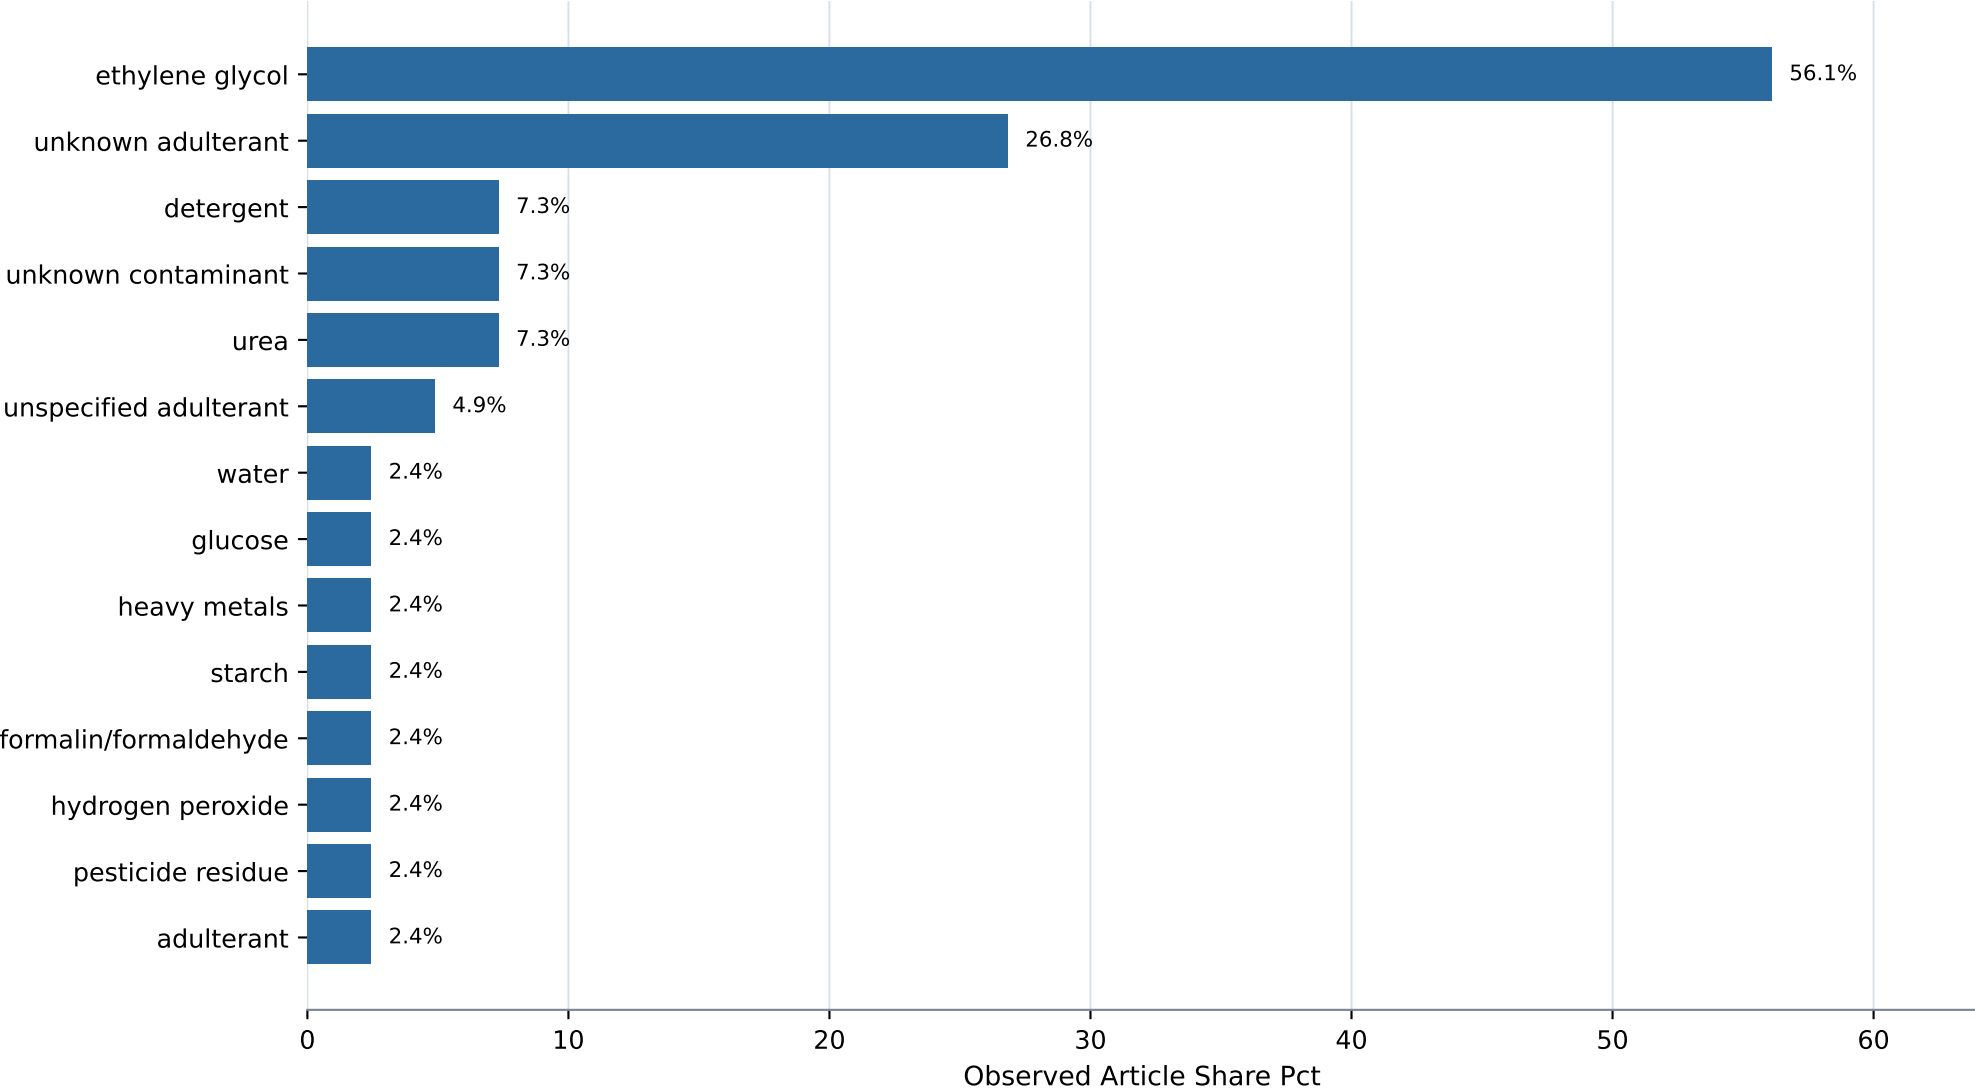

Directly joined food-adulterant-effect chains

Causal-chain evidence levels

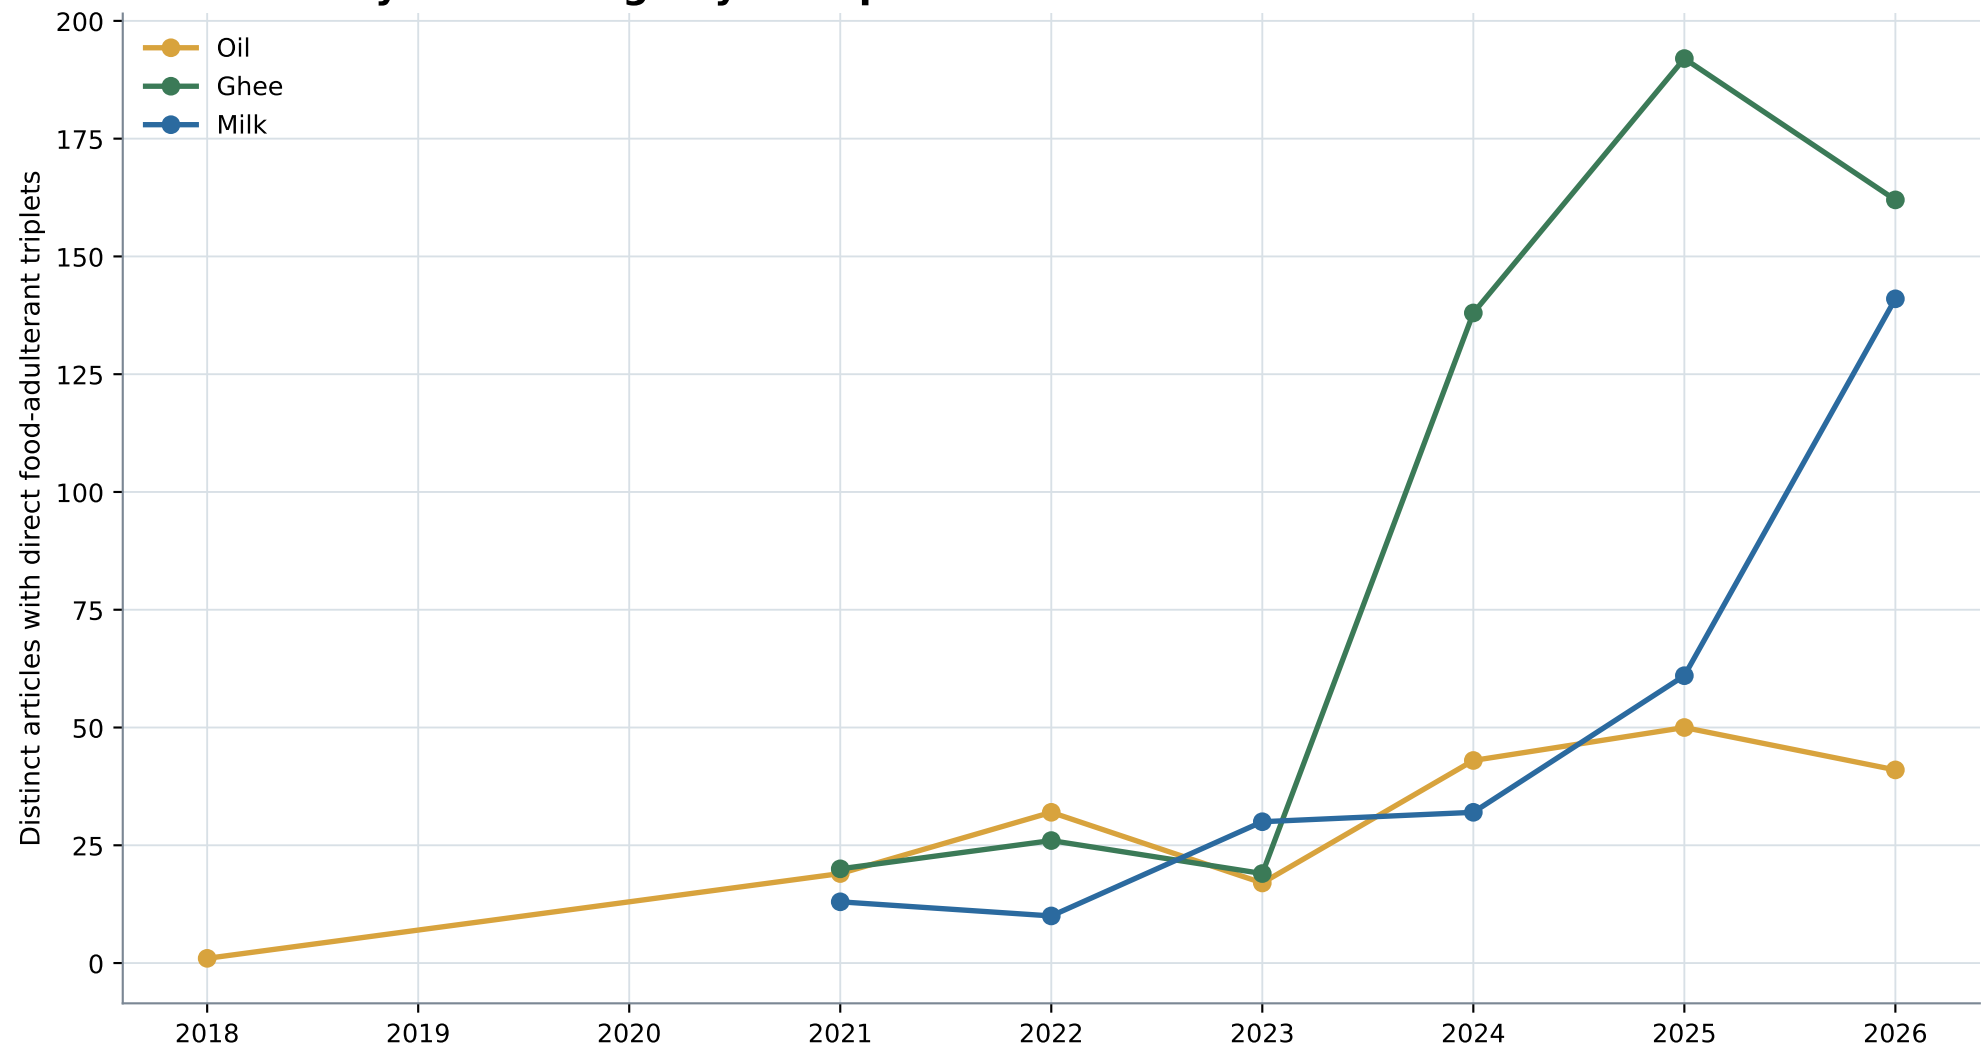

Candidate presence given Milk and renal-failure context

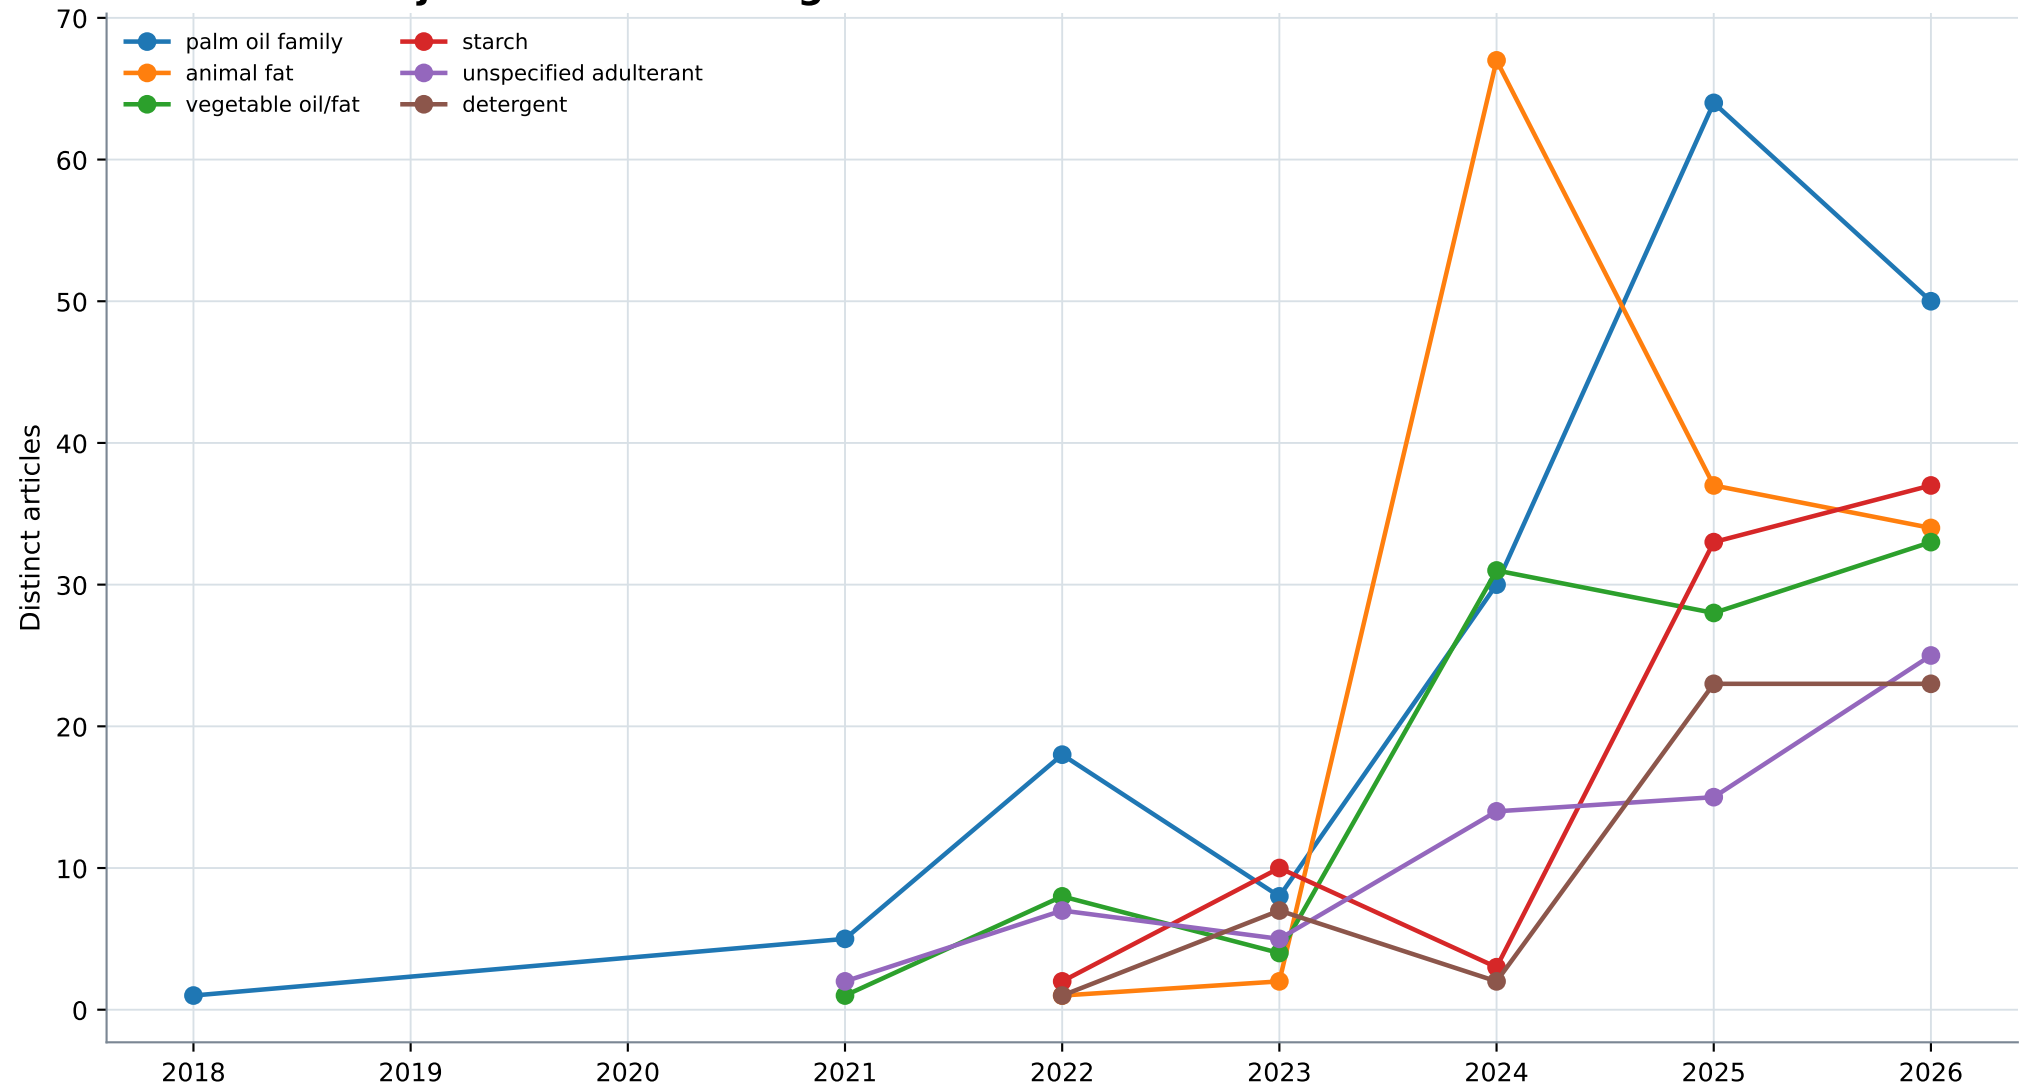

Food specificity of leading adulterant candidates

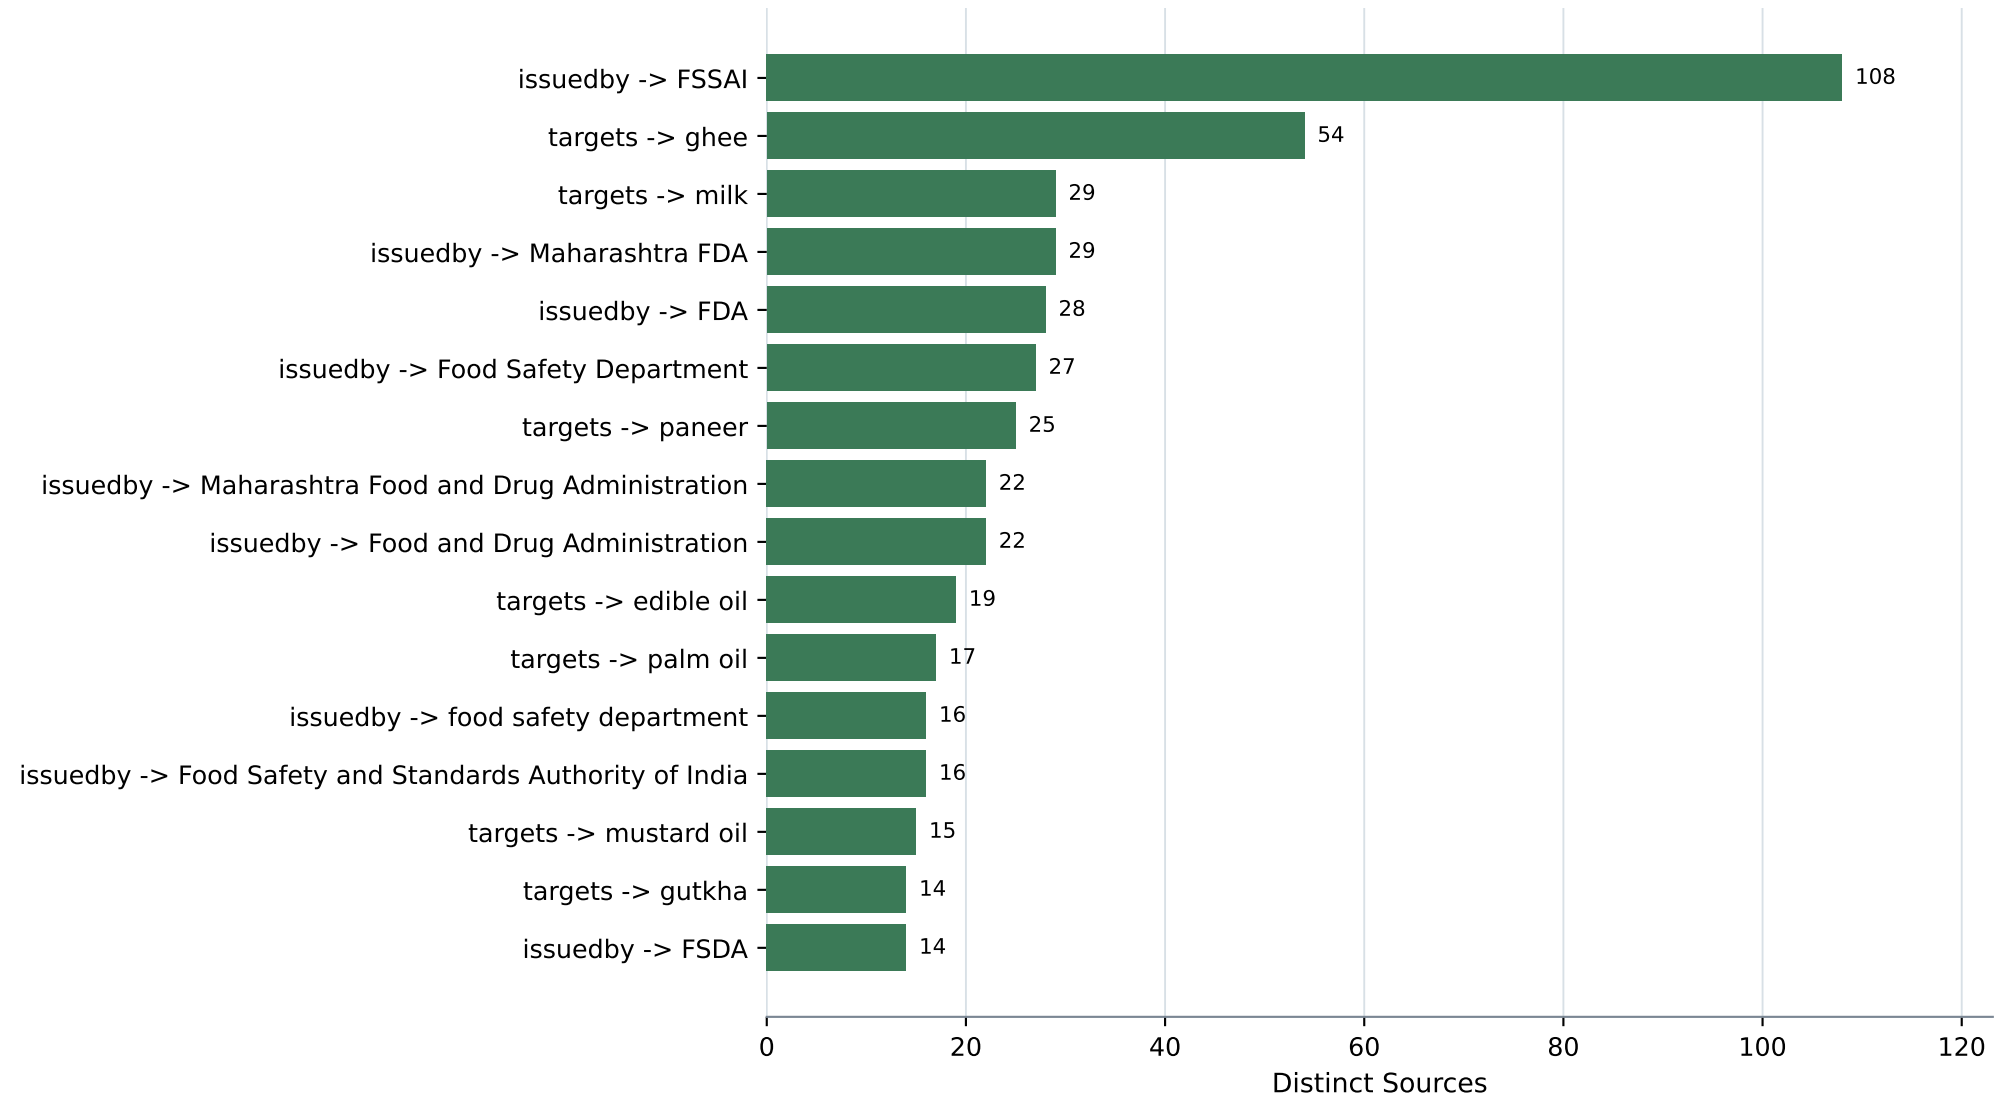

Publication-year coverage by food pool

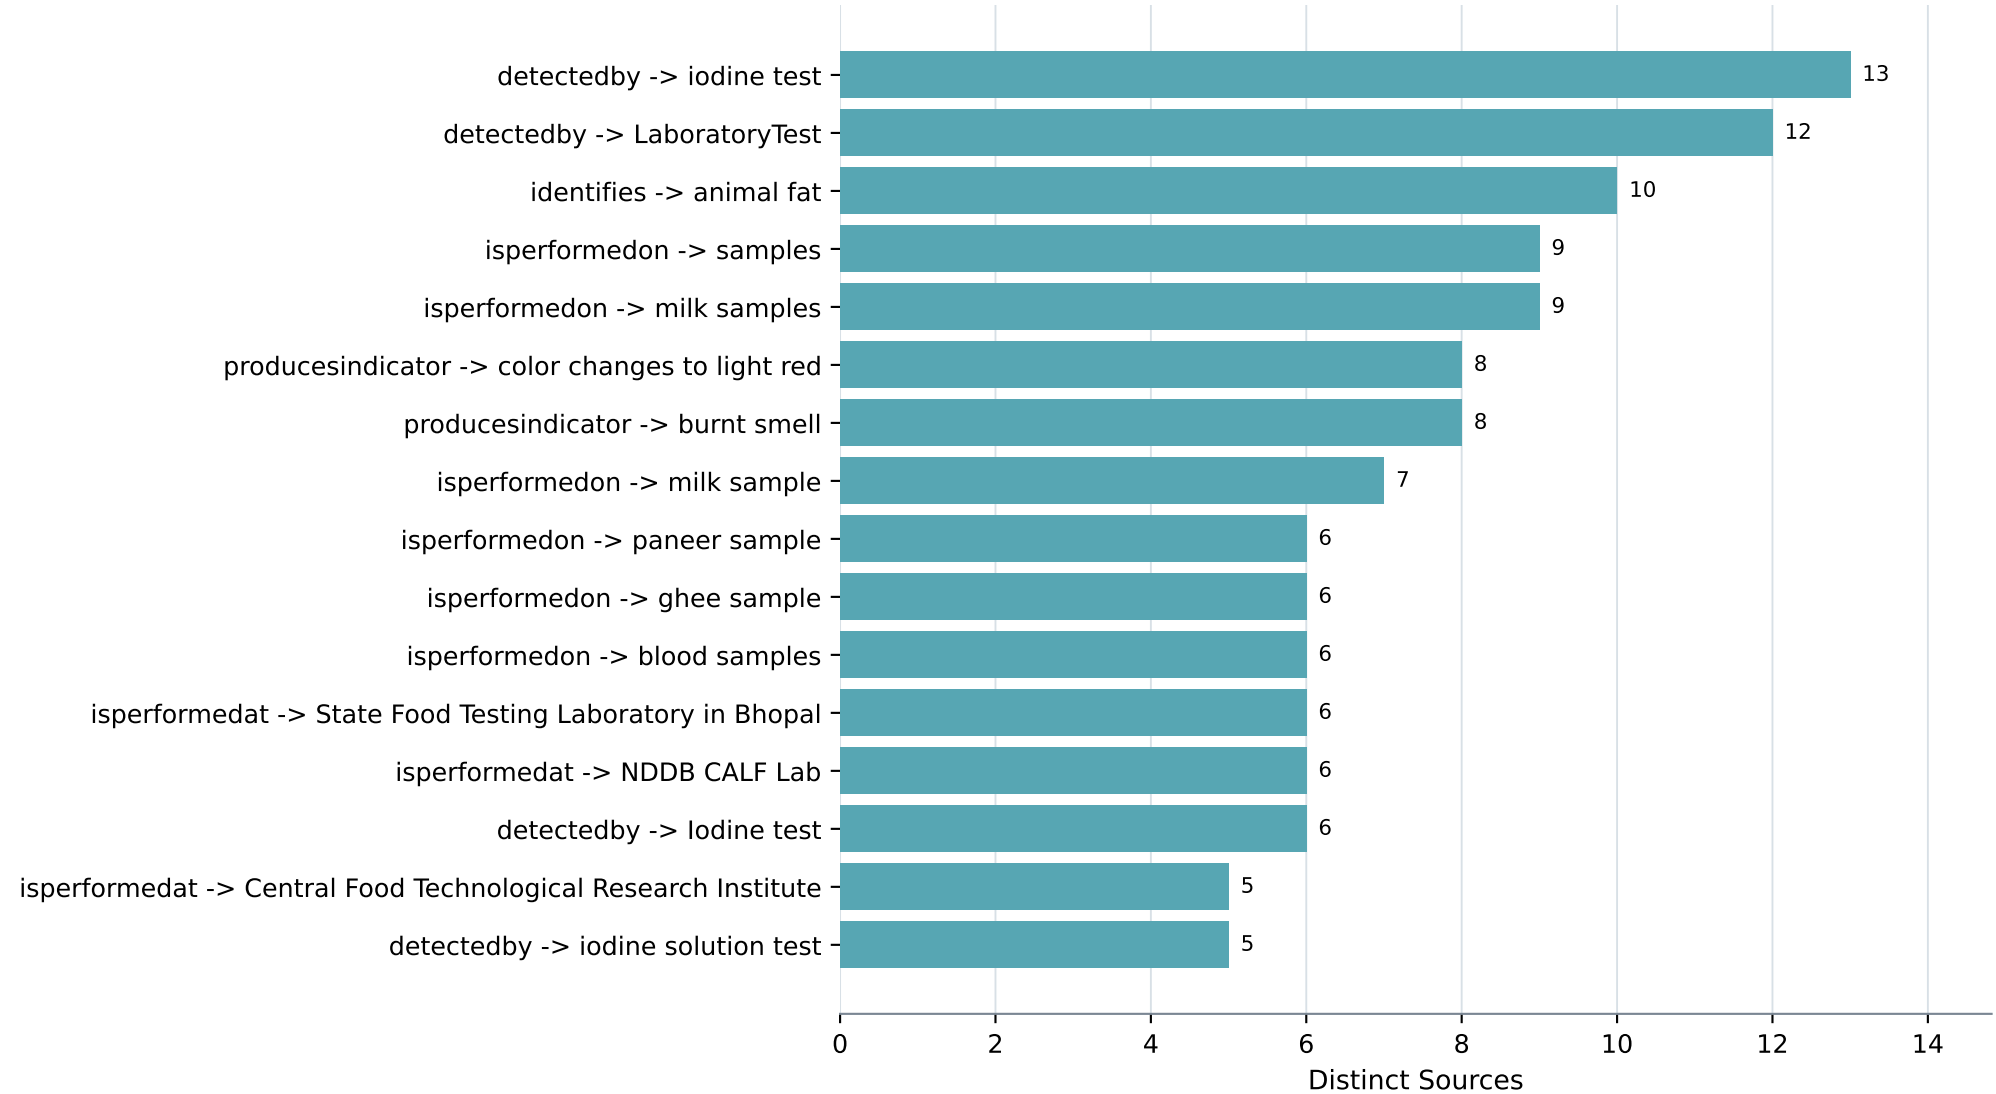

Publication trajectories of leading candidates

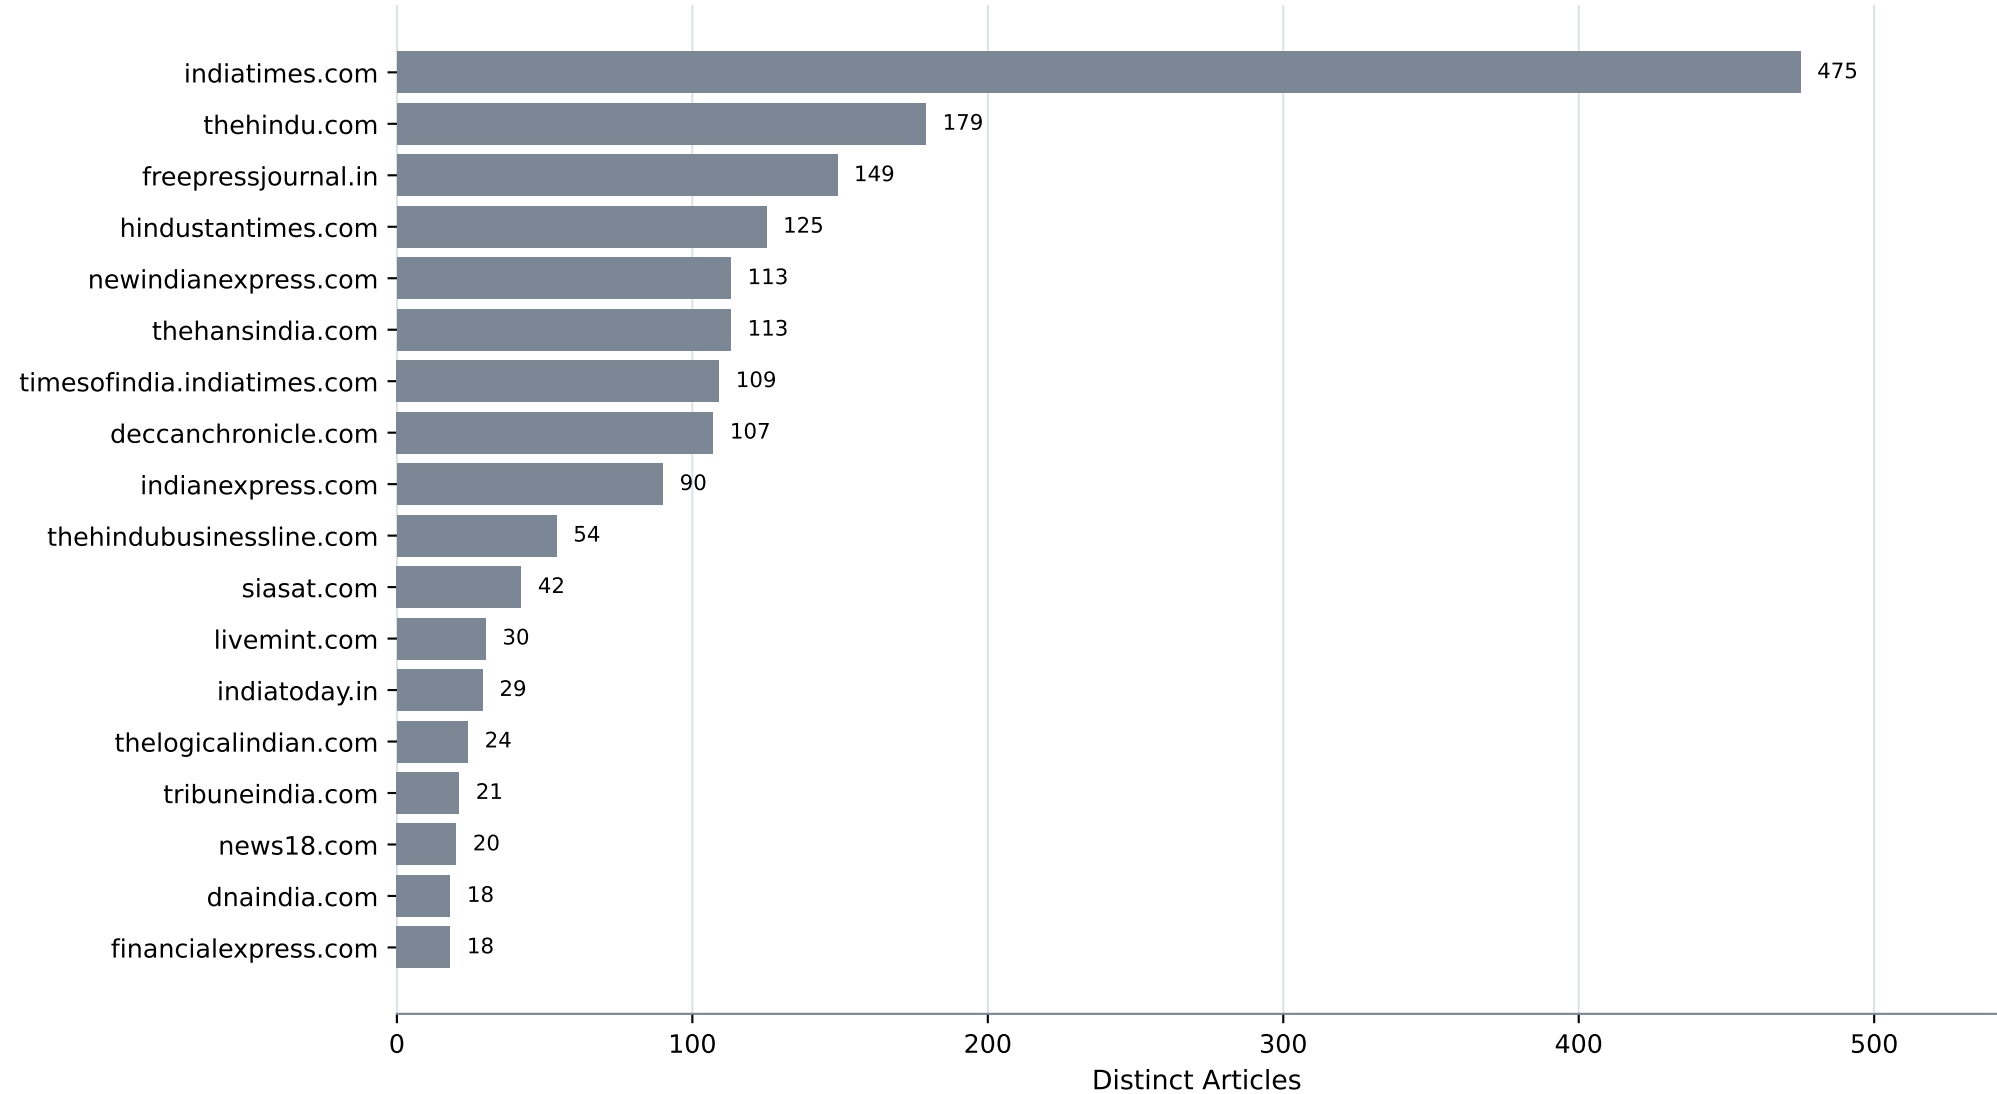

Most represented regulatory-action relations

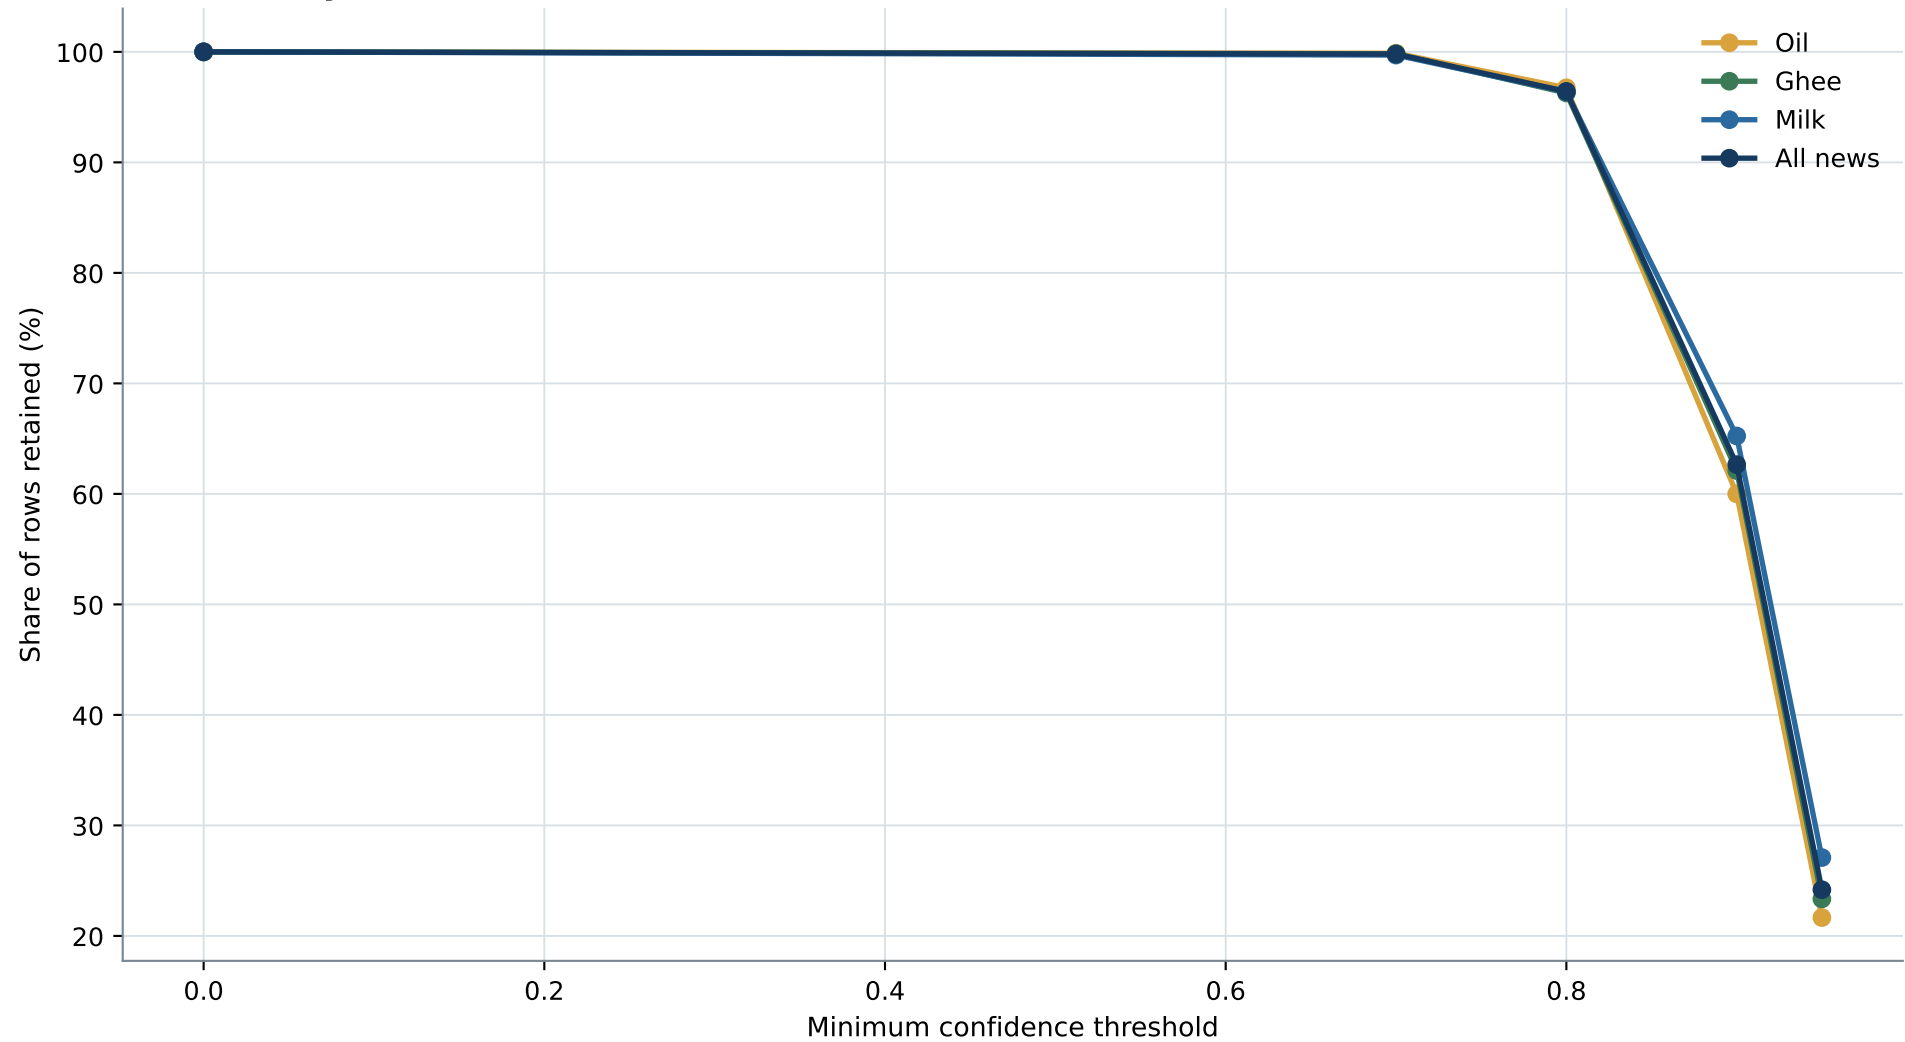

Most represented news detection and method relations

News-source concentration

Sensitivity to confidence thresholds

Leading directly joined causal-chain network
